## **Commonly Used Abbreviations and Acronyms**

Following is a list of abbreviations and acronyms used throughout this report.

- AAAC—Access Assessment Advisory Committee
- ◆ A&I—Audits & Investigations Division
- CAHPS—Consumer Assessment of Healthcare Providers and Systems<sup>1</sup>
- ◆ CBAS—Community Based Adult Services
- CFR—Code of Federal Regulations
- ◆ CHIP—Children's Health Insurance Program
- CMB—California Medical Board
- CMS—Centers for Medicare & Medicaid Services
- COHS—County Organized Health System
- CPT—Current Procedural Terminology
- DHCS—California Department of Health Care Services
- DMHC—California Department of Managed Health Care
- EAS—External Accountability Set
- ◆ EDI—electronic data interchange
- ENT—Ophthalmology, Otolaryngology, Rhinology
- EQRO—external quality review organization
- FTE—full-time equivalent
- FQHC—federally qualified health center
- GMC—Geographic Managed Care
- HEDIS—Healthcare Effectiveness Data and Information Set<sup>2</sup>
- HIPAA—Health Insurance Portability and Accountability Act of 1996
- ♦ HRSA—Health Resources and Services Administration
- ♦ HSAG—Health Services Advisory Group, Inc.
- ICF—intermediate care facility
- IDSS—Interactive Data Submission System
- KKA—Knox-Keene Health Plan Service Act of 1975

-

<sup>&</sup>lt;sup>1</sup> CAHPS® is a registered trademark of the Agency for Healthcare Research and Quality (AHRQ).

<sup>&</sup>lt;sup>2</sup> HEDIS® is a registered trademark of the National Committee for Quality Assurance (NCQA).

- LTSS—long-term services and supports
- MCMC—Medi-Cal Managed Care
- MCO—managed care organization
- MCP—managed care health plan
- MMIS—Medicaid Management Information System
- MPH—miles per hour
- NCQA—National Committee for Quality Assurance
- NEMT—non-emergency medical transportation
- ♦ NENMT—non-emergency non-medical transportation
- NMT—non-medical transportation
- NP—nurse practitioner
- OB/GYN—obstetric/gynecological
- ◆ PA—physician assistant
- PACES—Post-Adjudicated Claims and Encounters System
- PAHP—prepaid ambulatory health plan
- ◆ PCP—primary care physician
- PIHP—prepaid inpatient health plan
- PLD—patient-level detail
- QASP—qualified autism services practitioner
- RHC—rural health clinic
- SNF—skilled nursing facility
- STCs—Special Terms and Conditions
- WIC—Welfare and Institutions Code

## 1. Executive Summary

On December 30, 2015, California's Section 1115(a) Medicaid Waiver Renewal, titled California Medi-Cal 2020 Demonstration (Medi-Cal 2020), was approved by the Centers for Medicare & Medicaid Services (CMS). The Special Terms and Conditions (STCs)<sup>3</sup> set forth by CMS and DHCS established the conditions and limitations on the waivers and expenditure authorities. In accordance with the Medi-Cal 2020 STCs, California is required to conduct a one-time assessment of Medi-Cal Managed Care (MCMC) beneficiaries' access based on current Medi-Cal managed care health plan (MCP) network adequacy requirements. This Access Assessment assessed MCMC beneficiaries' access to primary, core specialty, and facility services, as well as compliance with MCP network adequacy and timely access requirements and standards. Following approval to move forward with the Access Assessment on July 25, 2016 (Senate Bill 815), DHCS amended its contract with Health Services Advisory Group, Inc. (HSAG), the State's current external quality review organization (EQRO), to design and conduct the required Access Assessment.

## **Results Summary**

The following sections provide an overview of the most relevant results for MCMC beneficiary access to Medi-Cal health care services.

## **Network Capacity**

- Statewide, between 48 and 62 percent of non-facility-based providers were active (defined as having provided services to an MCP beneficiary). The active rate for facility-based providers was 20 percent.
- For most MCPs that served regions with multiple urbanicities, a slightly greater proportion of adult primary care physicians (PCPs), adult core specialty, facility-based, non-core specialty, and non-physician medical practitioners were located in the more densely populated areas, suggesting that beneficiaries residing in less dense regions of the State may face greater challenges accessing these providers.
- For pediatric PCP and core specialty providers, most MCPs showed slightly disproportionately more providers in the less densely populated regions covered by the MCPs. This was particularly evident when OB/GYN providers were excluded from the core specialty providers.

-Draft Copy for Review-

<sup>&</sup>lt;sup>3</sup> California Medi-Cal 2020 Demonstration, Special Terms and Conditions. (2017, January 19). Available at:

## Geographic Distribution

- Most MCPs met the time/distance standards for at least 99 percent of their beneficiaries. Only a small number of MCPs did not meet the time/distance standards for inpatient and outpatient hospitals for at least 99 percent of their beneficiaries.
- For a small number of MCPs, when limited to providers accepting new patients, fewer beneficiaries were within the established time/distance standards.
- Beneficiaries in rural and small urbanicity regions faced substantially longer time/distance travel to several core specialty service providers.

## **Availability of Services**

- Telehealth was primarily used in rural and small urbanicity regions.
- Use of telehealth services was almost non-existent for pediatric beneficiaries. While there was wide variation between the use of telehealth services across MCPs for adults, this health care delivery method was relatively unutilized. Note that at the time this report was produced, DHCS was in the process of expanding its telehealth policy, which is currently limited and only based on a few current procedural terminology (CPT) codes.
- Non-emergency non-medical transportation (NENMT) was used more in densely populated regions and less in sparsely populated regions. Note that DHCS expanded the transportation policy on July 1, 2017, to require MCPs to cover non-medical transportation (NMT) for their beneficiaries and non-emergency medical transportation (NEMT) for carved out services. HSAG did not receive time-series NENMT data and therefore was unable to determine the impact of this change.
- For Healthcare Effectiveness Data and Information Set (HEDIS®) measures for which there is a minimum performance level, rural regions generally exhibited lower rates compared to other urbanicity regions.
- Higher ambulatory emergency department visit rates for rural regions may indicate a lack of access to other options, such as urgent care clinics.

## Access to Care Monitoring

DHCS demonstrated an overall well-defined, compliant approach to implementing the final rule for Medicaid managed care (42 CFR §438) in support of network adequacy and timely access standards. DHCS' website included the published network adequacy standards and exceptions as well as the DHCS proposal which explained its approach in an easily understandable manner for public view.4 While the language contained in the published MCMC boilerplate contracts could be updated to show a clearer association with DHCS' approach, DHCS generally had documentation to support Code of Federal Regulations (CFR) alignment when

<sup>&</sup>lt;sup>4</sup> Assembly Bill (AB) 205 (Chapter 738, Statutes of 2017) codified and amended California's network adequacy standards.

combined with other available source documents. DHCS also showed robust stakeholder engagement in its implementation strategy.

HSAG identified four gaps in DHCS' proposed approach for implementing the final rule as related to 42 CFR §438.68 Network adequacy standards and §438.206 Availability of services:

- No language was identified in any source documents which acknowledged that the enrollee's choice of provider was considered in the development of the Long-Term Services and Supports (LTSS) standards. Note that DHCS indicated its state-specific LTSS standards will be addressed through the California Code, Welfare and Institutions Code— WIC §14197.
- Boilerplate contract source documents did not contain language that specified the exceptions process as required; however, DHCS indicated it has updated the contract to address this requirement and that the updated contract is under review by CMS.
- Source documents did not contain an explicit statement indicating the services available to managed care organization (MCO), prepaid inpatient health plan (PIHP), and prepaid ambulatory health plan (PAHP) enrollees including all State plan services; however, DHCS indicated it has updated the contract to address this requirement and that the updated contract is under review by CMS.
- Source documents did not include language indicating whether emergency services are the only contracted services expected to be made available 24 hours a day, seven days a week; however, DHCS indicated this requirement will be addressed in the 2019–20 contract amendment.

#### **Conclusions and Considerations**

While there were a few areas in which individual MCPs did not meet standards, the results of the California Medi-Cal 2020 Demonstration Access Assessment suggest there are no critical access issues requiring immediate attention. Several themes emerged from the assessment and are described below.

In general, areas with rural urbanicity showed more challenges with access to care. There was significantly greater utilization of telehealth services in rural areas; however, given the relatively small utilization rate for telehealth services for adults and the nearly non-existent use of telehealth services for pediatric services, it is unclear whether telehealth services were sufficient to compensate for some of the challenges associated with health care in rural regions of the State.

Results indicated unused provider capacity that can be leveraged both within the pool of providers contracted with MCPs and within the pool of physicians licensed to practice within California, although this may not hold for specific types of specialty providers or all urbanicity regions.

The results of the analyses suggest a number of opportunities and considerations:

- In general, MCPs can increase the number of non-physician medical practitioners and still be well within the physician to non-physician medical practitioners ratio requirements, with the possible exception of small urbanicity regions.
- Increases in telehealth services may serve to enhance access for beneficiaries in rural regions, particularly to specialized services, although additional, more focused research may be necessary to fully understand the extent to which this is feasible and effective.
- Results show that approximately 36 percent of physicians licensed to practice in California are not contracted with an MCP, which presents an opportunity to expand and/or enhance MCP physician networks. However, it should be noted that data available for this analysis were insufficient to determine available capacity in rural regions of the State.
- For non-facility-based providers statewide, between 48 and 62 percent of providers contracted with a given MCP have provided services to an MCP beneficiary for which they are contracted. The active rate for facility-based providers was 20 percent. Greater engagement of contracted providers could expand and/or enhance MCMC beneficiary access to services.
- Both DHCS and MCPs should consider partnerships with the Health Resources and Services Administration (HRSA) or HRSA grantees to implement and ensure compliance with rural health best practices.

While the results of the assessment provide insight into the current state of access to care for MCMC beneficiaries, there are also areas of future research that may provide additional insight and improve access:

- Use of grievance and complaints data provides an avenue to identify unmet needs but relies on beneficiary self-selection, producing results that are likely to be biased. The inclusion of survey data, such as Consumer Assessment of Healthcare Providers and Systems (CAHPS®) data, may help to enhance future access assessments or related research.
- ♦ A follow-up study examining the use of telehealth services in less densely populated regions to determine the extent to which telehealth services are sufficiently allowing beneficiaries in rural and small urbanicity regions to obtain necessary specialist services could provide a quantitative estimate of this relationship.
- Using the results of telehealth research, DHCS may want to consider development of specific measures and corresponding standards for the provision of telehealth services in rural and small urbanicity regions of the State that would reasonably be expected to ensure adequate access to Medi-Cal services.

## 2. Background

## Overview of California's Section 1115(a) Medicaid Waiver Renewal

On December 30, 2015, California's Section 1115(a) Medicaid Waiver Renewal, titled *California Medi-Cal 2020 Demonstration (Medi-Cal 2020)*, was approved by CMS. *Medi-Cal 2020* continues the State's commitment to improving California's health care delivery system and builds on the successes of the previous 2010 Section 1115(a) *Bridge to Reform* waiver. Critical to the ongoing success and viability of MCMC, the *Medi-Cal 2020* waiver serves to guide the California DHCS through the next five years as DHCS works to transform the quality of care, access to care, and the efficiency of health care services for MCMC beneficiaries.

The STCs set forth by CMS and DHCS established the conditions and limitations on the waivers and expenditure authorities. They describe in detail the nature, character, and extent of federal involvement in the demonstration along with the State's obligations to CMS during the life of the demonstration. In accordance with the *Medi-Cal 2020* STCs, California is required to conduct a one-time assessment of MCMC beneficiaries' access based on current Medi-Cal MCP network adequacy requirements. The Access Assessment assessed MCMC beneficiaries' access to primary, core specialty, and facility services, as well as compliance to MCP network adequacy and timely access requirements and standards.<sup>6</sup> Where possible, the Access Assessment incorporated geographic, beneficiary, and provider characteristics into the review, including considerations in response to any systemic network adequacy issues identified.

Following approval on July 25, 2016 (Senate Bill 815), DHCS amended its contract with HSAG, the State's current EQRO, to design and conduct the required Access Assessment. Effective October 23, 2016, HSAG began working with DHCS to develop the overall Access Assessment design, including facilitation of an advisory committee formed to provide input on the assessment structure. As required by the STCs, the Access Assessment design outlined the proposed methods for addressing the STCs and assessing MCMC beneficiaries' access to health care services. CMS approved the design on September 19, 2018, and HSAG followed the design to execute the approved data collection, calculation of access-related measures, and reporting of MCP and State compliance with existing network adequacy and timely access requirements.

Accessed on: Jan 17, 2019.

<sup>&</sup>lt;sup>6</sup> Network standards assessed in this Access Assessment are based on requirements outlined in the Knox-Keene Health Plan Service Act of 1975 (KKA) and current MCMC contracts.

## **Key Components of Access Assessment**

The requirements for the *Medi-Cal 2020* Access Assessment included the following key components:

Establishment of the Access Assessment Advisory Committee (AAAC)—Based on submitted applications, DHCS selected 18 committee members in 2016 to participate on an advisory committee tasked with providing feedback on the overall assessment design and the final report. The AAAC members were selected from a variety of backgrounds including consumer advocacy organizations, providers/provider associations, health plans/health plan associations, legislative staff, and MCMC beneficiaries. The mix of committee members ensured diverse, robust input on the development of the assessment methodology.

Facilitated by HSAG, the AAAC members' meeting initially occurred on three separate occasions.<sup>7</sup> Attendees reviewed and offered suggestions on the continued development of the Access Assessment design. In 2019, the AAAC met once more to review the draft report to provide feedback prior to the draft report being posted for public comment.

- Preparation and Submission of an Access Assessment Design to CMS—Working collaboratively with DHCS and the AAAC, HSAG developed a detailed assessment design for DHCS to submit to CMS for review and approval. The Access Assessment design highlighted the data sources, access measures, and assessment methods identified to support the review of the adequacy of Medi-Cal beneficiaries' access to services. Once CMS approved the Access Assessment design, HSAG and DHCS had 10 months to execute it.
- Preparation and Submission of Initial Draft and Final Access Assessment Reports— Once the Access Assessment results were compiled, HSAG reviewed the assessment findings with DHCS. HSAG then produced an initial draft report and submitted the draft Access Assessment report to DHCS and the AAAC. Upon receiving feedback, HSAG modified the draft report. DHCS will post the draft report on its website for public comment and include documentation of the AAAC's feedback. Following closure of the public comment period, HSAG will prepare a final report for submission to DHCS and CMS.

\_

<sup>&</sup>lt;sup>7</sup> The AAAC was convened on November 18, 2016, January 31, 2017, and March 28, 2017; meetings were open to the public.

## **Access Assessment Objectives**

Based on the requirements outlined in the STCs and the goals of *Medi-Cal 2020*, the Access Assessment addressed the following objectives:

- 1. Assess MCP network adequacy and performance for managed care beneficiaries.
- 2. Assess MCP network compliance with established network standards and timely access requirements.<sup>8</sup>
- 3. Assess compliance with network adequacy requirements across MCPs and lines of business.
- 4. Identify differences between the State's current network monitoring program and the requirements outlined in the Medicaid and Children's Health Insurance Program (CHIP) managed care final rule (42 CFR §438).

The Access Assessment design, considering the four objectives outlined above, used the access performance measures and analytic approach to address multiple dimensions of access (i.e., network capacity, geographic distribution, and availability of services), as described in Section 3—Access Assessment Framework.

-

Network standards reported in this Access Assessment are based on requirements outlined in the KKA and MCMC contracts.

## 3. Access Assessment Framework

## **Scope of the Access Assessment**

The scope of work of this Access Assessment includes an investigation of MCP network adequacy for managed care beneficiaries covered by the Knox-Keene Health Plan Service Act of 1975 (KKA) and existing MCMC contracts. As a one-time study, the Access Assessment provides a broad, cross-sectional profile of both Medi-Cal and MCP provider networks as well as a comparison of network performance relative to established network standards<sup>9</sup> and outcomes. Specifically, the Access Assessment:

- Measured MCP compliance with existing network adequacy and with timely access requirements set forth in the KKA and MCMC contracts.<sup>10</sup>
- ◆ Expanded the evaluation of provider networks beyond existing provider categories identified in existing regulations and included additional primary and core specialty services and facilities. Additionally, the assessment incorporated other nontraditional health care service modalities (e.g., telemedicine) based on the availability of data.
- Incorporated validated network data from a one-year period for the most recent time period available at the time of the analyses. Moreover, to capture multiple aspects of access, the assessment synthesized information from multiple sources, including the most recent provider network data, beneficiary and encounter data inclusive of sub-capitated MCP data, ombudsman calls, previously collected appointment availability data, and grievances and appeals/complaints data.
- Reviewed network compliance and performance of MCPs relative to overall, statewide provider networks available in the State of California (e.g., all licensed providers).
- Accounted for geographic differences (i.e., urban versus rural) and network status (i.e., inor out-of-network).
- Presented network adequacy and timely access findings at the State contractor MCP level as well as key beneficiary, provider, and geographic subpopulations as noted previously.

Focusing on the Medi-Cal-only managed care population, the Access Assessment was limited to evaluation of California's managed care service areas. Additionally, while HSAG used some beneficiary demographics to assess network adequacy, HSAG did not disaggregate results by clinical or program-based subpopulations (e.g., disabled beneficiaries, foster care children).

-

<sup>9</sup> Network standards assessed in this Access Assessment are based on requirements outlined in the KKA and MCMC contracts.

<sup>&</sup>lt;sup>10</sup> Please note that while CMS has finalized the Medicaid Managed Care rule (42 CFR §438), the current Access Assessment is limited to evaluation of existing standards in MCMC. As such, new network requirements were not directly incorporated into this assessment.

Due to existing limitations in the collection of applicable data, direct analyses of access to care by lines of business were not possible. However, the Access Assessment included the collection and analysis of licensing data from the California Medical Board (CMB) data to conduct a high-level comparison between the MCP provider network and available provider network in California, regardless of payer. At the time of crafting the STCs, DHCS believed that data on other lines of business were readily available through another State agency. However, DHCS discovered that data on lines of business other than Medicaid were not readily available. The 10-month window allotted to prepare the Access Assessment report did not allow sufficient time for DHCS to coordinate with other State agencies and the MCPs to develop a process to capture and submit these data in a format suitable for analysis. Additionally, it was not feasible within the 10-month time frame to define and coordinate the collection of a new data source or to incorporate the findings into the report. Also, since the data being collected and reported by the MCPs varied in structure, format, quality, and content, there was not enough time to use these data for other lines of business, which would have required DHCS to assess what information was being collected and to evaluate the methods used by each MCP before a comparative review of the data could have been conducted. HSAG attempted to address the concept of differential availability of providers based on contracted lines of business using data from the CMB. These data were used to conduct a high-level comparison between the MCP provider network and available provider network in California, regardless of payer, and will highlight potential differences that could contribute to access issues.

## **Assessment Framework**

As noted earlier, the purpose of the Access Assessment was to document the accessibility of California's MCMC provider networks and to assess compliance with existing network standards and requirements. To fully understand and measure access and availability, HSAG used a multidimensional framework to conduct the analysis. Access represents a complex construct concerned with understanding whether beneficiaries can obtain and use the health care resources necessary to maintain and/or improve their health. Figure 3.1 illustrates three key dimensions necessary to exploring and understanding beneficiary access to care (i.e., Network Capacity, Geographic Distribution, and Availability of Services).

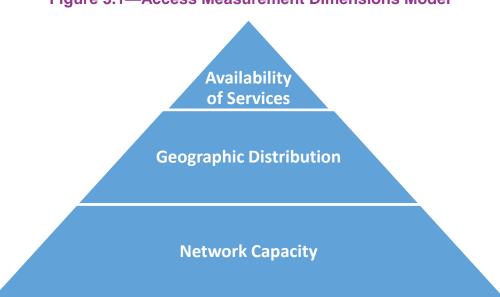

Figure 3.1—Access Measurement Dimensions Model

The dimensions presented in Figure 3.1 are interrelated and each necessary to consider when developing a comprehensive view of access. *Network Capacity* addresses the underlying foundation of the provider network and refers to the supply of provider services available to beneficiaries. It addresses two key questions:

- Are health care services available?
- Is there an adequate supply of service providers available?

Using a variety of measures (e.g., provider-to-beneficiary ratios and provider counts), an assessment of the underlying capacity of a provider network can be obtained. If services are available and an adequate supply of providers and services are present, the opportunity to obtain health care exists, suggesting that beneficiaries *may* have access to services. Once capacity and infrastructure are established, it becomes important to understand the extent to which beneficiaries can *gain access* to reported services. However, gaining access to and utilization of services are dependent upon physical accessibility and acceptability of services, not simply on adequacy of supply. *Geographic Distribution* addresses whether the distribution of available services is adequate to facilitate access to all beneficiaries. Two key questions guiding assessments in this dimension include the following:

- Is the geographic distribution of providers relative to the beneficiary population reasonable?
- Does the geographic distribution of providers mirror the social, cultural, and clinical needs of the beneficiary population?

Key measures for assessing the geographic distribution of providers include time/distance analyses and compliance with network adequacy requirements. When combined with beneficiary and provider characteristics, these analyses determine the extent to which the supply of providers is distributed appropriately relative to the beneficiary population. However, even with adequate capacity and appropriate distribution of services, assessing the *availability* 

of relevant services is critical in making sure beneficiaries have access. The third dimension of access, *Availability of Services*, is important for understanding the extent to which network services are relevant and effective in producing positive health outcomes. Key questions addressed by this dimension include the following:

- Are relevant services available for beneficiaries to achieve acceptable health outcomes?
- Is the availability of services timely?
- Does the use of services reflect appropriate management of health outcomes?

The availability of services can be assessed in terms of appointment availability, utilization, and/or outcomes of services. Taken together, the three dimensions offer a broad understanding of the factors impacting beneficiaries' access to care. The framework addresses the intersection of a network's underlying infrastructure (i.e., making services available), distribution (i.e., getting the services to beneficiaries), and availability (i.e., having the right kind of services available when needed).

Although described in detail in Section 4—Access Assessment Design, Figure 3.2 illustrates the key network performance measures that HSAG used within each access dimension.

Figure 3.2—Network Performance Measures by Access Dimension

## Network Capacity

- Physician ratios
- Provider statistics

# Geographic Distribution

- Time/distance analysis
- Network adequacy

## **Availability of Services**

- Use of services
- Appointment availability
- Grievances and appeals/complaints

## **Intersecting Dimensions of Access**

Taken individually, the dimensions of access described in Figure 3.2 are incomplete. Instead, evaluation of network adequacy should encompass all three dimensions in order to understand the impact of both network infrastructure and the implementation and actions of that infrastructure. While individual dimension results are important, the interaction of provider capacity and geographic distribution, along with appointment availability, provide a comprehensive picture of the adequacy of the MCMC provider networks.

To ensure that Medi-Cal beneficiaries have the potential to access the health care services that they need, HSAG assessed the existing capacity of MCPs' provider networks and the ability of those networks to afford access to health care services (i.e., *Network Capacity*). This component is key to establishing adequate access, although it is insufficient on its own to support the access and availability expectations of MCMC beneficiaries. Insufficient providers and the lack of specialists in a network have a direct impact on beneficiaries' access to care. HSAG also examined the extent to which the distribution of Medi-Cal enrolled providers' practice locations mirror those of the beneficiary populations they serve (i.e., *Geographic Distribution*). Even with a large network of enrolled providers, if the providers are not distributed appropriately and proportionally relative to the beneficiaries, access to care will be adversely affected. Beneficiaries' access to local care is critical to ensuring that beneficiaries receive the health care services they need.

In addition to understanding the underlying provider network infrastructure, HSAG also assessed how well the network addresses the needs (clinical and cultural) of the beneficiaries (i.e., *Availability of Services*). For example, while a sufficient number of providers may be enrolled in a network and distributed proportionally relative to the enrolled beneficiary population, the providers must be active and willing to accept Medi-Cal patients. While individual dimension results are important, the interaction of provider capacity and geographic distribution, along with availability of services, is critical to developing a comprehensive picture of the adequacy of California's MCMC network provider networks.

## 4. Access Assessment Design

The primary objective of the Access Assessment was to explore and assess Medi-Cal managed care beneficiaries' access to primary, core specialty, and facility services. As outlined in Section 3, HSAG employed a multidimensional, analytic approach to investigate existing levels of access as well as compliance with the managed care network adequacy requirements set forth in the KKA and current MCMC contracts. HSAG assessed access to care using a combination of network performance measures including descriptive statistics, point-in-time estimates and trend analyses, and utilization metrics. Synthesizing the results across each measure provides a comprehensive profile of the capacity, distribution, and availability of health care services available to MCMC beneficiaries.

Although HSAG presented results at the statewide and MCP levels, the Access Assessment includes a series of comparative analyses that target the impact of key beneficiary, provider, and geographic (i.e., urban versus rural) characteristics on MCMC beneficiaries' access to care. These subgroup comparisons help DHCS understand how access to services is affected by both geographic setting and beneficiaries' characteristics, as well as by differences in managed care provider networks. The following section outlines the population, data sources, and analytic methods that HSAG used to conduct the Access Assessment.

## **Study Population**

The network analysis results were based on HSAG's comparative evaluations of both MCMC beneficiaries and the providers who serve them. Additionally, HSAG defined comparison groups or subpopulations of beneficiaries and select providers to evaluate network performance across key demographics and MCPs.

Specifically, the primary study population included MCMC beneficiaries residing within the State of California and enrolled in an MCP as of December 1, 2017. For measures evaluated over time, HSAG evaluated MCMC beneficiary enrollment based on the first day of each month between March 2017 and December 2017. See Appendix A for a complete listing of MCPs included in the Access Assessment.

The study population also included individual and facility-based providers who were active and enrolled with an MCP between March 1, 2017, and December 31, 2017. Table 4.1 shows the specific provider categories that HSAG used to calculate provider-based measures in the Access Assessment, including PCPs, core specialists, and facilities.

#### Table 4.1—Provider Categories Included in the Access Assessment

<sup>&</sup>lt;sup>B</sup>This category includes providers who deliver mental health services in outpatient settings including, but not limited to, licensed clinical social workers, licensed marriage and family therapists, clinical nurse specialists, and psychologists.

Provider Category	Provider Specialty/Type	
Primary Care Physician	<ul><li>Family Practice</li><li>General Practice</li><li>Geriatrics</li><li>Internal Medicine</li></ul>	<ul> <li>Obstetrics/Gynecology<sup>A</sup></li> <li>Pediatrics</li> <li>Preventive</li> </ul>
Non-Physician Medical Practitioner <sup>11</sup>	<ul><li>Physician Assistant (PA)</li><li>Nurse Practitioner (NP)</li></ul>	◆ Certified Nurse Midwife <sup>A</sup>
Core Specialty Care <sup>12</sup>	<ul> <li>Cardiovascular         Disease/         Interventional         Cardiology</li> <li>Dermatology</li> <li>Endocrinology</li> <li>Gastroenterology</li> <li>General Surgery</li> <li>Hematology/Oncology</li> <li>Infectious Diseases</li> <li>Mental Health         Outpatient Services<sup>B</sup></li> </ul>	<ul> <li>Nephrology</li> <li>Neurology</li> <li>Obstetrics/Gynecology<sup>A</sup></li> <li>Ophthalmology</li> <li>Ophthalmology, Otolaryngology, Rhinology (ENT)</li> <li>Orthopedic Surgery</li> <li>Pediatric Mental Health Specialists</li> <li>Pediatric Physical Health Specialists</li> <li>Physical Medicine and Rehabilitation</li> <li>Psychiatry</li> <li>Pulmonary Disease</li> </ul>

<sup>&</sup>lt;sup>11</sup> Except in instances where nonphysician practitioners were being evaluated for compliance with existing network standards, categorization of nonphysician medical practitioners was based on defined specialties. To eliminate inflation of network performance measures, HSAG excluded nonphysician medical practitioners with no designated specialty.

\_

<sup>&</sup>lt;sup>A</sup> Obstetricians/Gynecologists and Certified Nurse Midwives were evaluated both within the PCP category, when identified as PCPs, and independently.

<sup>&</sup>lt;sup>12</sup> The current list is based on provider types required to meet network adequacy at the time of the evaluation design. The current and codified list is located in WIC §14197 found at <a href="https://codes.findlaw.com/ca/welfare-and-institutions-code/wic-sect-14197.html">https://codes.findlaw.com/ca/welfare-and-institutions-code/wic-sect-14197.html</a>.

Provider Category	Provider Specialty/Type
Facility-based and Specialty Providers	<ul> <li>Community Based Adult Services (CBAS)</li> <li>Federally Qualified Health Center (FQHC)</li> <li>Home Health</li> <li>Hospital, Inpatient</li> <li>Hospital, Outpatient</li> <li>Intermediate Care Facility (ICF)</li> <li>Rural Health Clinic (RHC)</li> <li>Skilled Nursing Facility (SNF)</li> </ul>

#### **Data Collection and Sources**

To complete the Access Assessment, HSAG collected and managed multiple data sources to assess access across three key dimensions (i.e., network capacity, geographic distribution, and availability of services). The data collected included both administrative and survey-based data (i.e., post-audit timely access verification study). Administrative data sources included information extracted from DHCS' Medicaid Management Information System (MMIS) and maintained in DHCS' data warehouse, including beneficiary, provider, and encounter data, as well as other MCMC data (i.e., grievances, appeals, and complaints). The MMIS databases were the main repositories of the data that HSAG used to conduct the assessment.

#### Administrative Data

Administrative data represent information collected, processed, and stored in electronic information systems, often as part of an agency's or organization's health care operations. As such, this information is readily available and frequently monitored to ensure its completeness and accuracy. Following are descriptions of the relevant administrative data sources that HSAG used in conducting the Access Assessment.

#### Data Warehouse—Beneficiary Data

HSAG used beneficiary data to identify the population required to calculate all network performance measures as well as to classify MCMC beneficiaries by key characteristics (i.e., age, gender, race/ethnicity, and language). More specifically, HSAG first combined the beneficiary demographic data with eligibility and enrollment data to determine the Access Assessment population (i.e., active beneficiaries enrolled in an MCP), and then segmented the population to conduct subpopulation analyses (e.g., compliance with time/distance standards by geography). HSAG used these data to calculate provider-to-beneficiary ratios, population counts and trends, subpopulation comparisons, and geographic-based distribution statistics.

Demographic, eligibility, and enrollment data were extracted from the DHCS data warehouse for the time period March 1, 2017, through December 31, 2017, to account for all network performance measure time periods.

#### Data Warehouse—Provider Data

Provider data represent another key data source for defining the Access Assessment population. Provider databases include critical information on provider demographics and practice characteristics (i.e., location, specialty, and network status). HSAG used these data to calculate provider-to-beneficiary ratios, provider counts and network trends, subpopulation comparisons, and geographic-based distribution statistics.

All MCPs reported managed care provider data according to the Healthcare Provider Information Transaction Set (274) through DHCS' Post-Adjudicated Claims and Encounters System, or PACES. In March 2017, the MCPs' provider data reporting transitioned from the State proprietary format to the 274 format. For this study, provider data were extracted from the DHCS data warehouse for the time period March 1, 2017, through December 31, 2017, to align with the availability of the 274 provider data.

Note that due to the frequency of changes in provider practices (e.g., acceptance of new patients, network status, and office location), provider data were accurate as of the time of submission. Additionally, certain fields related to practice characteristics may be incomplete or require additional reconciliation due to differences in the data collection and classification processes at individual MCPs.

#### Data Warehouse—Encounter Data

In state fiscal year (SFY) 2014–15, DHCS implemented PACES, from which DHCS used managed care encounter data to calculate a series of utilization measures in order to assess the availability of services. DHCS extracted Electronic Data Interchange (EDI) 837 Health Care Claim transaction sets for inpatient, outpatient, and professional services and used them to calculate service utilization rates across different health care settings. HSAG analyzed the service utilization results by MCP and beneficiary demographics to provide insight into beneficiary patterns of service utilization and access. HSAG also linked managed care aggregated encounter data to beneficiary and provider data to standardize the calculation of rates and draw comparative analyses across key characteristics.

Due to expected submission lags associated with Medi-Cal's encounter data, HSAG worked with DHCS to extract inpatient, outpatient, and professional encounters for the time period January 1, 2017, through December 31, 2017, to account for all network performance measure time periods.

#### **Health Care Consumer Data**

Health care consumer data represent supplemental health care information collected and managed by DHCS and the California Department of Managed Health Care (DMHC), which are the entities responsible for the oversight and management of MCMC. Specifically, HSAG used data related to denial of services (i.e., beneficiary complaints, grievances, and appeals; and ombudsman calls). HSAG used each of these data sources to categorize and examine the extent to which beneficiary complaints and grievances are related to access issues. HSAG combined these data with beneficiary enrollment data to standardize rates and conduct comparative analyses across MCPs and by key demographic characteristics.

Although each data source is available on a differing schedule (e.g., monthly, quarterly), data from each source were collected for the time period January 1, 2016, through December 31, 2017, with rates being reported monthly.

#### **HEDIS IDSS and PLD Files**

The Interactive Data Submission System (IDSS) data contain HEDIS data collected and reported by the Medi-Cal MCPs. This audited information is used to report each MCP's results for Medi-Cal's External Accountability Set (EAS), a set of performance measures selected annually by DHCS to monitor MCP performance. HSAG used a subset of measures from this data source to report key HEDIS measures highlighting beneficiaries' access to care. Additionally, all MCPs are required to submit both NCQA-required Patient-Level Detail (PLD) files and CA-specific PLD files as part of the HEDIS audit process. The PLD files contain beneficiary-level results.

HEDIS measures reported in the Access Assessment covered dates of service that fell during the time period November 6, 2016, through December 31, 2017.

#### **Medical Licensing Data**

In addition to using data maintained by DHCS and DMHC, HSAG worked with the CMB to obtain provider information on all licensed physicians for the State of California. Information from the CMB allowed for high-level comparisons between the MCMC provider network and the potential provider network through the State of California, regardless of payer.

HSAG received CMB licensure data and identified active licensure for the time period March 1, 2017, through December 31, 2017, using the original issue date and expiration date.

#### Survey-Based Data

Survey-based data represent information collected directly from beneficiaries and providers and reflect patient and provider experiences. As noted in the STCs, HSAG used data collected through DHCS' Audits & Investigations Division (A&I) to assess appointment availability and compliance with timely access standards outlined in the KKA and MCMC contracts. Data collected through these surveys identified appointment wait times associated with the first, second, and third available appointments. To assess timely access, the Access Assessment incorporated results from the audit, verification, and post-audit studies conducted by DHCS.

Survey data related to timely access was procured for the time period January 1, 2016, through December 31, 2017.

Table 4.2 summarizes the data sources that HSAG used for California's Access Assessment.

#### **Table 4.2—Data Source Summary**

Note: Differences in data source time periods are based on the availability of data.

Data Source	Data Owner	Used in Monitoring	Time Period for Data		
Administrative Data Sources	Administrative Data Sources				
Beneficiary data	DHCS	Yes	2/01/16–12/31/17		
274 Provider data	DHCS	Yes	03/01/17–12/31/17		
Encounter data	DHCS	Yes	03/01/17–12/31/17		
Grievance and Appeals data	DHCS	Yes	01/01/16–12/31/17		
Ombudsman Call data	DHCS	Yes	01/01/17–12/31/17		
HEDIS IDSS and PLD data	DHCS	Yes	11/06/16–12/31/17		
CMB Licensing data	СМВ	No	03/01/17–12/31/17		
Survey-Based Data Sources					
Post-Audit Timely Access Verification Study data	DHCS	Yes	01/01/17–12/31/17		
2016 A&I Audit and Corrective Action Plan Verification Study data	DHCS	Yes	01/01/16–09/30/17		

## **Preliminary Access Review**

Following procurement of all beneficiary, provider, and service utilization data, HSAG conducted a preliminary review of the data sources. This review served two key purposes:

- 1. To finalize the selected data sources and analytic datasets
- 2. To assess the distribution of providers and beneficiaries by select population characteristics

Using selected data sources, HSAG cleaned, processed, and categorized beneficiary and provider data to define the final beneficiary and provider populations for inclusion in the Access Assessment as well as to define the final set of stratification variables. This process was critical for preparing the administrative data for analysis. HSAG standardized and geo-coded all provider files using Quest Analytics software. During the geo-coding process, HSAG analysts highlighted and corrected those addresses which included inaccurate ZIP Codes, where possible, to maximize the number of providers included in the assessment. HSAG limited the final MCMC beneficiary population included in the Access Assessment to beneficiaries residing within the State of California; however, HSAG included all providers contracted by Medi-Cal MCPs and located within the State of California or neighboring states (i.e., Arizona, Nevada, and Oregon) in the assessment. Acceptable of the preliminary file review involved confirming and evaluating the categorization of selected specialties and providers to ensure consistency across MCPs. HSAG excluded from the analysis providers with no specialty identified or with a specialty not matching the listed categories within the provider crosswalk.

Following the preliminary review, HSAG produced both demographic profiles and population counts by key stratification variables including the following:

- Beneficiary population counts by MCP, age, race/ethnicity, language, and geography
- Provider distribution counts at the State contractor MCP level by core specialty and specialty category, MCP, and geography
- Provider distribution counts by key office/practice characteristics, as available (e.g., network status [in- and out-of-network], panel size, accepting new patients), and level of activity<sup>14</sup>

—Draft Copy for Review—

<sup>&</sup>lt;sup>13</sup> HSAG individually evaluated outlier provider locations to ensure that no skewing or bias of provider-to-beneficiary ratio or time/distance results occurred.

<sup>&</sup>lt;sup>14</sup> Level of activity was evaluated by linking provider network data to encounters and identifying the volume of services rendered by a given provider. This analysis assists in defining the difference between being listed in an MCP's provider network and rendering services.
Differences noted in the analysis may indicate a gap in the provider network.

## **Analytic Methods**

As noted earlier, HSAG evaluated three dimensions of provider access and timely access (i.e., network capacity, geographic distribution, and availability of services). Together, results from these three dimensions provide insight into the underlying network infrastructure as well as its application and interaction with MCMC beneficiaries.

## **Network Capacity**

Network Capacity addresses the underlying infrastructure of a provider network. Measures of network capacity assess whether health services are available to beneficiaries through a sufficient supply and variety of providers. Following are descriptions of the three measures that HSAG used to assess the network capacity of MCMC provider networks.

#### **Beneficiary Count and Provider Supply**

HSAG calculated frequency distributions of both beneficiaries and physicians to provide a demographic profile of the MCMC beneficiary population and provider networks. In addition to presenting results by MCP and statewide, HSAG stratified the provider network counts by provider category and urbanicity to allow comparative analyses across key characteristics (e.g., MCP and provider category). In the results, HSAG highlighted, by strata, differences in the classification and/or count of beneficiaries and providers. Table 4.3 describes key specifications for this measure.

#### Table 4.3—Measure Specifications: Beneficiary and Provider Counts

\* Active providers were defined as (1) available in the 274 provider file, AND (2) having evidence (i.e., encounters) of rendering services to Medi-Cal members. If a provider did not have claims in the encounter data file during the study period, the provider was not considered active for the purposes of the analysis.

Measure Element	Description		
	<ul> <li>The number of unique beneficiaries enrolled in an MCP as of the first of the month for the measurement period, by MCP</li> </ul>		
Definition:	<ul> <li>The number of unique providers contracted with an MCP at any time during the month for the measurement period, by provider specialty</li> </ul>		
Data Source(s):  DHCS data warehouse—beneficiary data, provider data, encodata			
Measurement	◆ Point-in-time—December 1, 2017		
Period:	<ul> <li>Trend over time—monthly between March 2017 and December 2017</li> </ul>		

Measure Element	Description	
Stratification(s):	<ul> <li>For beneficiaries—age (i.e., adult/child), race/ethnicity, language, geography (i.e., urbanicity designation)</li> <li>For providers—provider specialty, urbanicity, active status*</li> </ul>	
Standard(s):	Not applicable	

#### **Medi-Cal Managed Care Provider Penetration Rate**

Calculation of the MCMC provider penetration rate allowed HSAG to examine the extent to which licensed physicians in the State of California are contracted with MCMC and its MCPs. Drawing upon CMB data, HSAG calculated the statewide percentage of licensed physicians<sup>15</sup> contracted with one or more MCPs. Due to limitations in the data received from the CMB and in DHCS' 274 data, only statewide analyses were conducted.

HSAG identified an issue related to accurately reporting the plan-level physician penetration rate for the Access Assessment. During the analysis, HSAG found that the physician's license number field in the 274 data was unreliable and that only a small fraction of physicians could be identified across both the CMB and provider 274 datasets. As a result, HSAG was unable to accurately identify and reconcile across the two datasets all practicing physician locations. This issue resulted in inaccurate, unreliable MCP-level penetration rates as locations included in the numerator (provider 274 data) were not necessarily included in the denominator (CMB data).

Additionally, when comparing CMB and provider 274 data, HSAG identified substantial differences in the number of specialties that physicians could report from these two data sources. This variance also rendered specialty-level penetration rates unreliable and inaccurate. As reflected in the CMB data, physicians were limited to only two specialties, whereas in the provider 274 data, there was no effective limit to the number of specialties that a physician could report. This, combined with the inability to accurately connect licensure data to the provider 274 data, resulted in unreliable, inaccurate penetration rates, specifically in that physicians may have appeared in the numerator but not in the denominator. Without the ability to accurately connect the two datasets, HSAG could not ensure physicians appeared in both the numerator and denominator. Even if the data allowed for accurate connection between the two datasets, the calculated penetration rates would still be inaccurate since HSAG had no way of calculating how many providers would list a given specialty in the CMB data if given the opportunity. This would mean that the denominator for any rate would be too small and the results would substantially overstate the penetration rate.

<sup>&</sup>lt;sup>15</sup> To the extent possible, the population of licensed physicians identified from the Medical Board data excluded physicians not actively practicing or accepting Medi-Cal beneficiaries.

Table 4.4 describes key specifications for this measure.

Table 4.4—Measure Specifications: Medi-Cal Managed Care Provider Penetration Rate

Measure Element	Description
Definition:	The percentage of unique physicians licensed in the State of California as of December 2017, that are contracted with one or more MCP
Data Source(s):	DHCS data warehouse—provider data CMB provider data
Stratification(s):	None
Standard(s):	Not applicable

#### **Provider-to-Beneficiary Ratio**

Calculation of the provider-to-beneficiary ratio (provider ratio) enabled HSAG to assess the number of providers associated with an MCP's provider network relative to the number of assigned beneficiaries. This measure is a summary statistic that HSAG used to highlight the overall capacity of an MCP's provider network to deliver services to MCMC beneficiaries. Specifically, the provider ratio measures the number of providers by physician specialty relative to the number of beneficiaries. A higher provider ratio suggests greater network access because a larger pool of providers is available to render services to individuals. However, caution should be used when interpreting the results of this statistic as it does not account for key practice characteristics (e.g., panel status and acceptance of new patients). Instead, this analysis should be viewed as establishing a theoretical threshold for an acceptable minimum number of providers necessary to support a given volume of beneficiaries.

To account for differences in the availability of individual physicians due to providers being contracted with two or more MCPs, HSAG adjusted provider counts using an estimate of a full-time equivalent (FTE). HSAG made this adjustment using two methods: <sup>16</sup> (1) equal distribution and (2) proportional distribution. The first method, equal distribution, distributes the FTE percentage equally based on the number of MCPs with which an individual physician is contracted. For example, if Provider X is contracted with four MCPs, that provider's FTE is equal to 0.25 FTEs for each MCP. Although this method accounts for impact on a provider's available panel size, it does not account for differences in proportional distribution of MCP populations. For example, in counties where the beneficiary population is distributed unequally across MCPs, large MCPs receive a disproportionately smaller percentage of the FTE relative to their beneficiary populations. As such, HSAG applied a second adjustment wherein the FTE

<sup>&</sup>lt;sup>16</sup> HSAG applied both provider ratio adjustments to primary care and core specialty physicians.

was distributed proportionally based on MCP beneficiary populations. 17 While both methods make broad assumptions regarding the availability of physicians for beneficiaries, the adjusted rates provide more robust estimates than do raw counts of physicians. Table 4.5 describes key specifications for this measure.

Table 4.5—Measure Specifications: Provider-to-Beneficiary Ratio

Measure Element	Description
Definition:	The number of provider FTEs relative to the number of MCMC beneficiaries, by MCP
Data Source(s):	DHCS data warehouse—beneficiary, provider data
Measurement Period:	<ul> <li>Point-in-time—December 2017</li> <li>Trend over time—monthly between March 2017 and December 2017</li> </ul>
Stratification(s):	Provider category, network status
Standard(s):	PCPs = 1: 2,000 Total Physicians = 1: 1,200 NP = 1 PCP: 4 NPs PA = 1 PCP: 4 PAs

-Draft Copy for Review-

<sup>&</sup>lt;sup>17</sup> Please note that the FTE calculation used for this study is different than the one DHCS currently uses in its network certification. The current FTE calculation DHCS uses was developed after the study design was submitted to CMS for approval in April 2017.

## Geographic Distribution

The second dimension of the Access Assessment evaluated the geographic distribution of providers relative to beneficiary populations. While the capacity analysis identified whether or not the network infrastructure is sufficient in both number of providers and variety of specialties, the geographic network distribution analysis determined whether or not provider locations are spread proportionally across the beneficiary population.

#### **Provider Counts by Physician Specialty and Geography**

Expanding on the frequency distributions calculated for beneficiaries and physicians for assessing network capacity, HSAG used provider counts by geography, which is a descriptive measure, to map provider counts by physician specialty and geographic region. In addition to presenting results by MCP and statewide, HSAG stratified the provider network counts by physician specialty and category to allow comparative analyses by category and by urbanicity<sup>18</sup> designation. Table 4.6 describes key specifications for this measure.

Table 4.6—Measure Specifications: Provider Counts by Geography

Measure Element	Description
Definition:	The number of unique, active providers contracted with an MCP, by provider specialty and by geography
Data Source(s):	DHCS data warehouse—beneficiary, provider data
Measurement Period:	<ul> <li>Point-in-time—December 2017</li> <li>Trend over time—monthly between March 2017 and December 2017</li> </ul>
Stratification(s):	For providers—provider specialty, network status, geography
Standard(s):	Not applicable

\_

<sup>&</sup>lt;sup>18</sup> Urbanicity (i.e., rural versus urban) was based on DHCS classification of counties. See Appendix A.

#### Time/Distance Analyses—Compliance with Time/Distance Standards

To provide a comprehensive view of geographic distribution of providers relative to beneficiary populations, HSAG calculated two spatially derived metrics: (1) percentage of beneficiaries within predefined access standards, and (2) the average distance and travel time to the nearest provider. Both analyses used Quest Analytics software to calculate the travel time or physical distance between addresses of beneficiaries and addresses of their nearest providers. HSAG stratified all results by MCP and by physician specialty.

Table 4.7 describes the measure specifications for determining the number and percentage of beneficiaries located within the predefined time/distance standards outlined in the KKA and MCMC contracts. This analysis was limited to provider types where standards currently exist (i.e., PCPs<sup>19</sup> and hospitals).

Table 4.7—Measure Specifications: Compliance with Time/Distance Standards

Measure Element	Description
Definition:	The percentage of beneficiaries whose addresses fall within the time/distance standard established in the KKA or MCMC contracts for PCPs and hospitals, by MCP
Data Source(s):	DHCS data warehouse—beneficiary, provider data
Measurement Period:	Point-in-time—December 2017
Stratification(s):	Network status
Standard(s):	For PCPs and hospitals—15 miles/30 minutes (KKA) or 10 miles/30 minutes (MCMC contract)

-Draft Copy for Review-

<sup>&</sup>lt;sup>19</sup> To the extent that data were available on whether or not PCPs are accepting new patients, time/distance results were assessed for the entire provider network and for those PCPs accepting new patients.

#### **Average Time and Distance to Nearest Three Providers**

HSAG assessed the average distance (in miles) and travel time (in minutes) between a beneficiary and the closest three providers for all provider and facility types listed in Table 4.1. A smaller average distance or shorter travel time<sup>20</sup> indicates greater accessibility to providers because individuals must travel fewer miles or minutes to access care. In general, the smaller the average distance between beneficiaries and providers across specialties, the greater the alignment in the geographic distribution of providers and beneficiaries. The average drive time and distance represent a standardized measure of the geographic distribution of providers relative to beneficiaries; the shorter the average drive time and distance, the greater the overlap in the distribution of providers relative to beneficiaries. Table 4.8 describes the specifications for this measure.

Table 4.8—Measure Specifications: Average Time and Distance to Nearest Three Providers

Measure Element	Description
Definition:	The average length of time and average distance to the nearest three providers for MCMC beneficiaries enrolled in an MCP as of September 1, 2017, by provider specialty and MCP
Data Source(s):	DHCS data warehouse—beneficiary, provider data
Measurement Period:	Point-in-time—December 2017
Stratification(s):	Beneficiary age, geography
Standard(s):	Not applicable

## **Availability of Services**

While the first two assessment dimensions assess provider network infrastructure, the following measures assess the extent to which the network infrastructure translates into practice. Measures of services available assess whether network services are relevant and effective in producing positive health outcomes. HSAG used two types of measures to assess availability of services in the MCMC provider networks.

Quest Analytics determined drive time based on the following parameters: 30 miles per hour (mph) for urban, 45 mph for suburban, and 55 mph for rural. Estimates did not account for time of day, traffic, or traffic control devices (e.g., stop signs, stop lights) and may not mirror driver experience due to varying traffic conditions.

#### **Access-Related Complaints, Grievances, and Appeals**

DHCS and DMHC monitor beneficiary experience through the collection and reporting of complaints, grievances, appeals, and ombudsman calls (all in the preceding list collectively referred to as grievances); this includes beneficiaries' access to health care services. HSAG calculated grievance rates<sup>21</sup> to show the extent to which beneficiaries are denied access to services or have issues accessing services. Specifically, HSAG calculated these measures as the number of access-related grievances per 1,000 member months. These measures are a summary statistic which HSAG will use to highlight the prevalence of access-related grievances for MCMC beneficiaries across MCPs. Table 4.9 describes specifications for these measures.

Table 4.9—Measure Specifications: Access-Related Complaints, Grievances, and Appeals

Measure Element	Description
Definition:	Two rates are calculated to measure access-related complaints, grievances, and appeals:  Complaints, Grievances, and Appeals: The number of access-related grievances during a rolling 12-month period per 1,000 member months, by quarter and MCP  Ombudsman Calls: The number of access-related grievances during calendar year 2017 per 1,000 member months, by MCP  Note: Separate rates were calculated for each grievance source
	(i.e., complaints, grievances, appeals, and ombudsman calls.
Data Source(s):	DHCS Data Warehouse—beneficiary data  MCMC data—complaints, grievances, appeals, ombudsman calls
Measurement Period:	Complaints, Grievances, and Appeals: 12-month rolling periods reported quarterly between January 2017 through December 2017  Ombudsman Calls: January 2017 through December 2017
Stratification(s):	Complaints, Grievances, Appeals: MCP, quarter Ombudsman Calls: MCP
Standard(s):	Not applicable

<sup>&</sup>lt;sup>21</sup> HSAG calculated two different but related access-related rates based on different data sources (i.e., beneficiary complaints, grievances, appeals and ombudsman calls).

#### **Service Utilization**

HSAG calculated utilization rates for several places of service to identify where beneficiaries are receiving services and to determine whether utilization patterns reflect appropriate management of health outcomes. Specifically, HSAG calculated, per 1,000 member months by MCP, rates of emergency department, urgent care, inpatient admissions, and outpatient visits. HSAG also assessed the utilization of alternative modalities (e.g., telemedicine). In the absence of standards, utilization rates were informational and were used comparatively to understand differences in how beneficiaries access services. Table 4.10 describes specifications for this measure.

Table 4.10—Measure Specifications: Utilization Rates per 1,000 Member Months

Measure Element	Description				
Definition:	The rate of services used by MCMC beneficiaries enrolled in an MCP, with an encounter between January 1, 2017, and December 31, 2017, for each of the following categories:  • Emergency department visits  • Urgent care visits  • Inpatient admissions  • Outpatient visits  • Mental health outpatient visits  • Telemedicine  • NENMT				
Data Source(s):	DHCS data warehouse—beneficiary data, MCMC encounter data				
Technical Specifications:	HEDIS 2017 Technical Specifications, Volume 2—Ambulatory Care (AMB) and Inpatient Utilization—General Hospital/Acute Care (IPU)				
Measurement Period:	January 1, 2017, through December 31, 2017				
Stratification(s):	Age, geography				
Standard(s):	Not applicable				

Additionally, using HEDIS IDSS and PLD files submitted by MCPs, HSAG reported a series of HEDIS measures designed to assess access to preventive, outpatient, and inpatient services. Table 4.11, Table 4.12, Table 4.13, and Table 4.14 describe the specifications for these measures.

Table 4.11—Measure Specifications: Well-Child Visits in the Third, Fourth, Fifth and Sixth Years of Life (W34)

Measure Element	Description					
Definition:	The percentage of MCMC beneficiaries 3 through 6 years of age and enrolled in an MCP who had one or more well-child visits with a PCP during the measurement year.					
Data Source(s):	DHCS—MCP IDSS and PLD files DHCS data warehouse—beneficiary data					
Technical Specifications:	HEDIS 2018 Technical Specifications, Volume 2—W34					
Measurement Period:	January 1, 2017–December 31, 2017					
Stratification(s):	Geography					
Standard(s):	For measurement year 2017: Minimum Performance Level = 66.18 High Performance Level = 82.77					

**Table 4.12—Measure Specifications: Ambulatory Care (AMB)** 

Measure Element	Description
Definition:	The rate of services used by MCMC beneficiaries enrolled in an MCP, with an encounter for ambulatory care between January 1, 2017, and December 31, 2017, for each of the following categories:  • Emergency department visits  • Outpatient visits
Data Source(s):	DHCS—MCP IDSS and PLD files DHCS data warehouse—beneficiary data
Technical Specifications:	HEDIS 2018 Technical Specifications, Volume 2—AMB
Measurement Period:	January 1, 2017–December 31, 2017

## **Table 4.13—Measure Specifications: Prenatal and Postpartum Care (PPC)**

Measure Element	Description					
Definition:	<ul> <li>The percentage of deliveries of live births on or between November 6 of the year prior to the measurement year and November 5 of the measurement year. For these women, the measure assesses the following:</li> <li>Timeliness of Prenatal Care. The percentage of deliveries that received a prenatal visit as an MCMC beneficiary enrolled in an MCP in the first trimester, on the enrollment start date, or within 42 days of enrollment in an MCP.</li> <li>Postpartum Care. The percentage of deliveries that had a</li> </ul>					
	postpartum visit on or between 21 and 56 days after delivery.					
Data Source(s):	DHCS—MCP IDSS and PLD files DHCS data warehouse—beneficiary data					
Technical Specifications:	HEDIS 2018 Technical Specifications, Volume 2—PPC					
Measurement Period:	Deliveries on or between November 6, 2016–November 5, 2017					
Stratification(s):	Age, geography					
Standard(s):	For measurement year 2017:  PPC-Prenatal: minimum performance level = 77.66 and high performance level = 91.67  PPC-Postpartum: minimum performance level = 59.59 and high performance level = 73.67					

Table 4.14—Measure Specifications: Children and Adolescents' Access to Primary Care Practitioners (CAP)

Measure Element	Description				
Definition:	The percentage of MCMC beneficiaries 12 months through 19 years of age who had a visit with a PCP.				
Data Source(s):	DHCS—MCP IDSS and PLD files DHCS data warehouse—beneficiary data				
Technical Specifications:	HEDIS 2018 Technical Specifications, Volume 2—CAP				
Measurement Period:	January 1, 2016–December 31, 2017				
Stratification(s):	Age, geography				
Standard(s):	Not applicable				

### **Appointment Availability**

To evaluate appointment availability, HSAG synthesized results from DHCS' Post-Audit Timely Access Verification Study and Corrective Action Plan Verification Study to evaluate the average length of time it takes for an MCMC beneficiary to schedule an appointment. However, since the data volume varies by MCP, the results should be used for information only. Table 4.15 and Table 4.16 describe two measures that examine the availability of appointments.

Table 4.15—Measure Specifications: Average Number of Days to Appointment

Measure Element	Description		
<b>Definition:</b> The average number of days to the soonest first, second, and thir appointments by MCP			
Data Source(s):	DHCS Post-Audit Timely Access Verification Study data Corrective Action Plan Verification Study data		
Measurement Period:	January 1, 2017–December 31, 2017		
Stratification(s):	Not applicable		
Standard(s):	Not applicable		

Table 4.16—Measure Specifications: Percentage of Appointments Compliant with Timely Access Standards

Measure Element	Description							
Definition:	The percentage of appointments that meet DHCS timely access standards by MCPs for the following appointment types:							
	<ul><li>Nonurgent, primary care</li><li>Urgent care</li></ul>	<ul><li>Specialist</li><li>First prenatal visit</li></ul>						
Data Source(s):	1	Primary: DHCS Post-Audit Timely Access Verification Study data Supplemental: 2016 A&I Audit and DHCS Corrective Action Plan Verification Study						
Measurement Period:		Primary: January 1, 2017–December 31, 2017 Secondary: January 1, 2016–September 22, 2017						
Stratification(s):	Not applicable							
Standard(s):	<ul> <li>For nonurgent, primary care—10 business days</li> <li>For urgent care—48 hours</li> <li>For a specialist—15 business days</li> <li>For first prenatal visit—two weeks (Geographic Managed Care [GMC] model and Two-Plan Model) or 10 business days (County Organized Health System [COHS] model)</li> </ul>							

# **Analysis of Access to Care Monitoring**

Although the Access Assessment was limited to assessing network adequacy and timely access based on the standards defined in the KKA and MCMC contracts, HSAG conducted a comparative desk review of California's existing network requirements, standards, and monitoring program relative to the Medicaid and CHIP revised final rule for Medicaid managed care (42 CFR §438). HSAG conducted a comprehensive review and comparison of the KKA and MCMC contracts, the Medicaid and CHIP revised final rule for Medicaid managed care, and any documentation outlining DHCS' proposed approach to implementing CMS' final rule.<sup>22</sup>

https://www.dhcs.ca.gov/formsandpubs/Documents/FinalRuleNAStandards3-26-18.pdf. Accessed on: May 9, 2019.

<sup>&</sup>lt;sup>22</sup> The DHCS Medicaid Managed Care Final Rule: Network Adequacy Standards lists all the current standards and is available at:

## **Access Assessment Limitations**

- PCPs were identified using two different methodologies. The first methodology identified PCPs using taxonomy codes outlined in the provider crosswalk. This methodology may overestimate the number of providers since all providers with a primary care taxonomy code (e.g., internal medicine) may not function as a PCP. The second methodology identified PCPs using the PCP flag identified in the provider 274 data. This method allows for all providers who function as a PCP, regardless of taxonomy, to be included in the estimate. The PCP flag represents a lower-bound estimate for PCP-related measures, while using taxonomy codes would represent an upper-bound estimate, or maximum potential, for PCP-related measures.
- Provider specialty taxonomy codes may not include both adult and pediatric categorizations, even though the provider serves both adult and pediatric populations (e.g., an endocrinologist may not be identified as a pediatric endocrinologist but may still provide services to a pediatric population).
- The provider penetration analysis was limited to a statewide analysis due to the physician's license number field in the provider 274 data being unreliable, and only a small fraction of physicians could be identified across both the CMB and provider 274 datasets. Additionally, when comparing CMB and provider 274 data, HSAG identified substantial differences in the number of specialties that physicians can report from these two data sources. This variance also rendered specialty-level penetration rates unreliable and inaccurate. Without the ability to accurately connect the two datasets, HSAG could not ensure physicians appeared in both the numerator and denominator.
- Time/distance metrics represent a high-level measurement of the similarity in geographic distribution of providers relative to beneficiaries. These raw, comparative statistics do not account for the individual status of a provider's panel at a specific location or the provider's level of activity in the Medicaid program. It is likely that some providers were contracted to provide services for multiple MCPs. As such, time/distance results only highlight the geographic distribution of a provider network and may not directly reflect the availability of providers at given office locations.
- When evaluating the results of these analyses, it is important to note that the reported average drive time may not mirror driver experience based on varying traffic conditions. Instead, average drive time should be interpreted as a standardized measure of the geographic distribution of providers relative to Medicaid beneficiaries; the shorter the average drive time, the more similar the distribution of providers is relative to beneficiaries.
- When evaluating the results presented in this report, note that data supplied in the provider 274 data did not include providers contracted with the health plans under limited use contracts or single case agreements. A larger number of beneficiaries may have access to providers if MCPs contract with selected providers under these limited use agreements versus standard contract agreements.
- A challenge associated with using service utilization rates to identify access issues is that differences in service utilization rates are driven by three fundamental factors: access to the service, MCP care management strategies, and differences in the risk of needing the

- services across beneficiary populations. To attribute differences in service utilization to differences in beneficiary access requires assuming that the effectiveness of MCP care management strategies is equal across MCPs and that the risk of needing the service is equal across beneficiary populations.
- Results based on the HEDIS measures were calculated using the patient-level data (PLD) files, which did not include results from medical record reviews. As such, the rates calculated for the HEDIS measures (i.e., AMB, CAP, PPC, and W34) were based on administrative data only and may not align with previous statewide reporting.
- The appointment availability results were based on DHCS' post-audit timely access verification study for calendar year 2017, which only included nine MCPs. Results may not be applicable to other MCPs. HSAG is aware that DHCS is currently conducting appointment availability studies with all MCPs and that those results should be considered for future analyses.

# 5. Findings

This section presents the key findings and outcomes of each network performance measure, by dimension of network adequacy. The results include MCP-specific results and aggregated statewide summaries, when appropriate, and are also presented according to key beneficiary and provider demographics.

# **Network Capacity**

### **Beneficiary Counts**

HSAG used beneficiary data provided by DHCS to develop a picture of the beneficiary population for each MCP and statewide. Specific beneficiary characteristics, such as geographic distribution, are presented alongside similar characteristics for providers to facilitate simple, direct comparisons related to access to health care services.

The findings in this section present general beneficiary characteristics which highlight the demographic diversity of the State and how those characteristics vary across MCPs. The results presented here are based on December 2017 data, with ages calculated as of December 1, 2017. HSAG assessed the changes in beneficiary counts by demographic characteristics over time but did not note substantial changes over time.<sup>23</sup>

Figure 5.1 displays MCP-specific and statewide age distribution.

<sup>&</sup>lt;sup>23</sup> Trend results are available upon request.

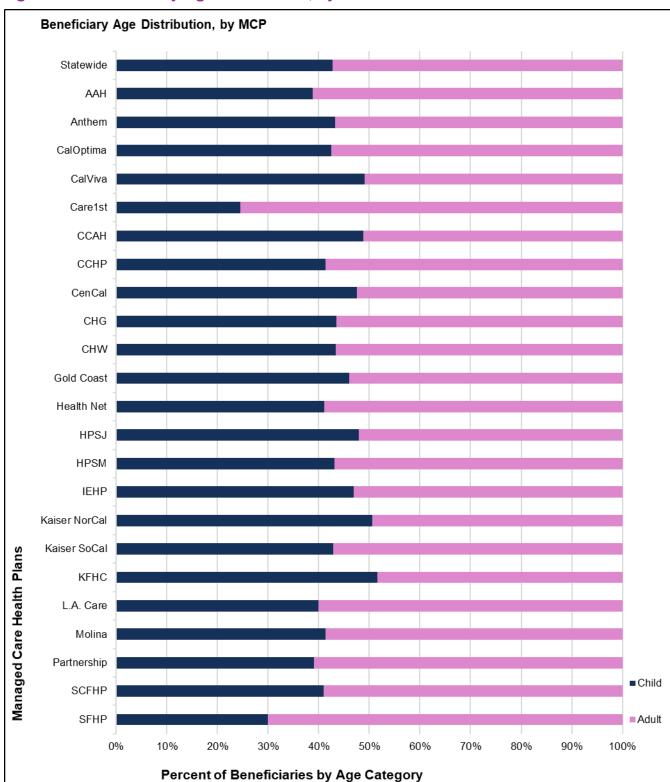

Figure 5.1—Beneficiary Age Distribution, by MCP

The key findings from Figure 5.1 are listed below:

- Approximately 43 percent of all MCP beneficiaries statewide were children (≤ 18 years old).
- A similar pattern was seen in most MCPs with only Care1st and SFHP deviating from the statewide average by more than 10 percentage points. Specifically, children comprised only about 24 percent of the beneficiaries enrolled with Care1st and only about 30 percent of beneficiaries enrolled with SFHP.

Appendix B contains detailed MCP-specific and statewide beneficiary counts, by age.

Figure 5.2 displays MCP-specific and statewide race/ethnicity distribution.

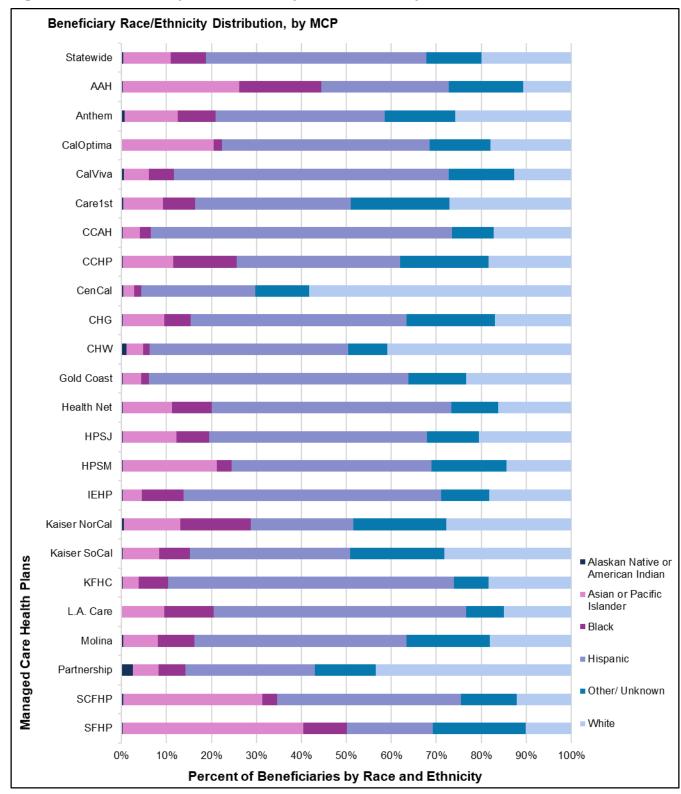

Figure 5.2—Beneficiary Race/Ethnicity Distribution, by MCP

The key findings from Figure 5.2 are listed below:

- Approximately 49 percent of all MCP beneficiaries were Hispanic, with the next-highest category being White, making up about 20 percent of enrolled beneficiaries. The Other/Unknown category comprised about 12 percent of all beneficiaries statewide.
- There were substantial differences across several MCPs reflecting the demographic diversity across the State:
  - Both SCFHP and SFHP had a substantially larger proportion of Asian and Pacific Islander beneficiaries than were found statewide. Asian and Pacific Islander beneficiaries comprised about 31 percent and 40 percent of the MCP's beneficiary population for SCFHP and SFHP, respectively.
  - For CenCal, CHW, and Partnership, White beneficiaries compromised a substantially larger portion of enrolled beneficiaries than was observed statewide.
    - For CenCal, White beneficiaries represented the majority of enrolled beneficiaries, comprising approximately 58 percent of all enrolled beneficiaries.
    - For Partnership, White beneficiaries represented the largest demographic group, representing about 43 percent of enrolled beneficiaries.
    - For CHW, Hispanic beneficiaries represented the largest demographic group, but the proportion of White beneficiaries (approximately 41 percent) was nearly twice that seen statewide.

Appendix B contains detailed MCP-specific and statewide beneficiary counts, by race/ethnicity.

Figure 5.3 shows MCP-specific and statewide distribution of primary languages spoken by beneficiaries.

Beneficiary Language Distribution, by MCP Statewide AAH Anthem CalOptima CalViva Care1st CCAH CCHP CenCal CHG CHW Gold Coast Health Net HPSJ HPSM **IEHP** Kaiser NorCal Kaiser SoCal Managed Care Health Plans KFHC L.A. Care Molina Partnership ■ English **SCFHP** ■ Spanish SFHP Other/ Unknown 90% 0% 10% 20% 40% 50% 60% 70% 80% 100% 30% Percent of Beneficiaries by Language

Figure 5.3—Beneficiary Language Distribution, by MCP

The key findings from Figure 5.3 are listed below:

- Approximately, 65 percent of all beneficiaries statewide reported English as their primary language. About 26 percent of beneficiaries reported Spanish as their primary language.
- Only about 8 percent of beneficiaries reported a primary language other than English or Spanish as their primary language (Other/Unknown).
- The racial and ethnic diversity observed in the beneficiary population was reflected in the diversity of primary languages across MCPs, with the most notable difference observed among SFHP beneficiaries. Approximately 38 percent of SFHP beneficiaries reported a language other than English or Spanish (categorized as Other/Unknown) as their primary language.

Appendix B contains detailed MCP-specific and statewide beneficiary counts, by primary language.

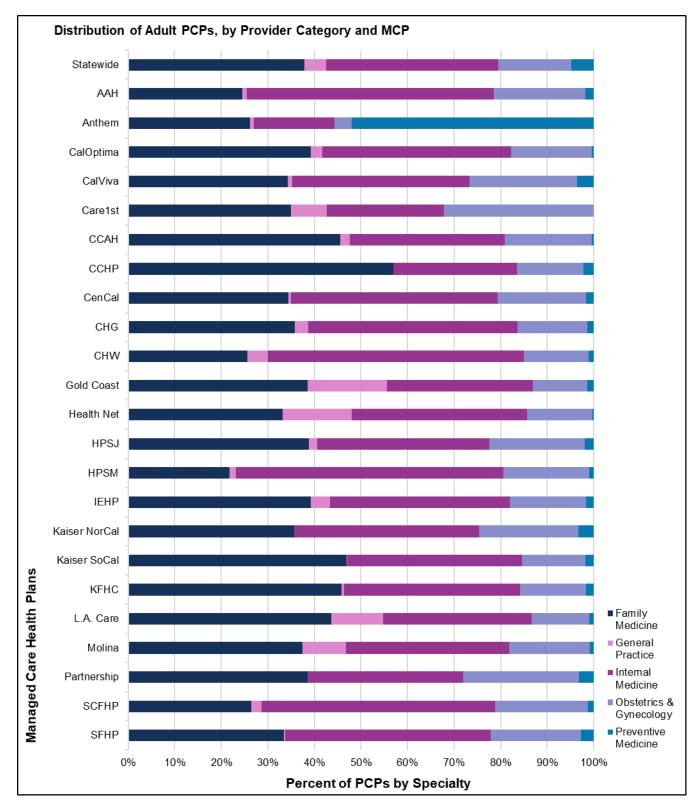

#### **Provider Counts**

HSAG used provider 274 data provided by DHCS to assess MCPs' provider networks. Specific provider characteristics, such as provider category, active status, and whether the provider was accepting new patients are presented to facilitate comparisons across MCP networks. The results presented here are based on December 2017 data, with ages calculated as of December 1, 2017. HSAG assessed the changes in provider counts over time but did not note substantial changes over time.<sup>24</sup>

<u>Adult PCPs:</u> Figure 5.4 displays MCP-specific and statewide distribution of adult PCP provider categories.

<sup>&</sup>lt;sup>24</sup> Trend results are available upon request.

Figure 5.4—Distribution of Adult PCPs, by Provider Category and MCP

The key findings from Figure 5.4 are listed below:

- Of the adult PCP provider specialties assessed, family medicine and internal medicine were the most frequently reported specialties statewide.
- Anthem reported approximately 52 percent of providers having a preventive medicine specialty, while the remaining MCPs reported having less than 5 percent preventive medicine providers.
- Four MCPs (i.e., AAH, CHW, HPSM, and SCFHP) reported more than 50 percent of providers having an internal medicine specialty.
- CCHP and Kaiser NorCal did not report providers with a general practice specialty.
- Care1st did not report providers with a preventive medicine specialty.
- Some MCPs reported multiple specialties for a given provider. Anthem reported the highest average number of specialties per provider.

Appendix B contains additional detail on the number of specialties per provider as well as MCP-specific and statewide provider counts, by adult PCP provider categories.

Figure 5.5 displays MCP-specific and statewide distribution of active adult PCP providers.

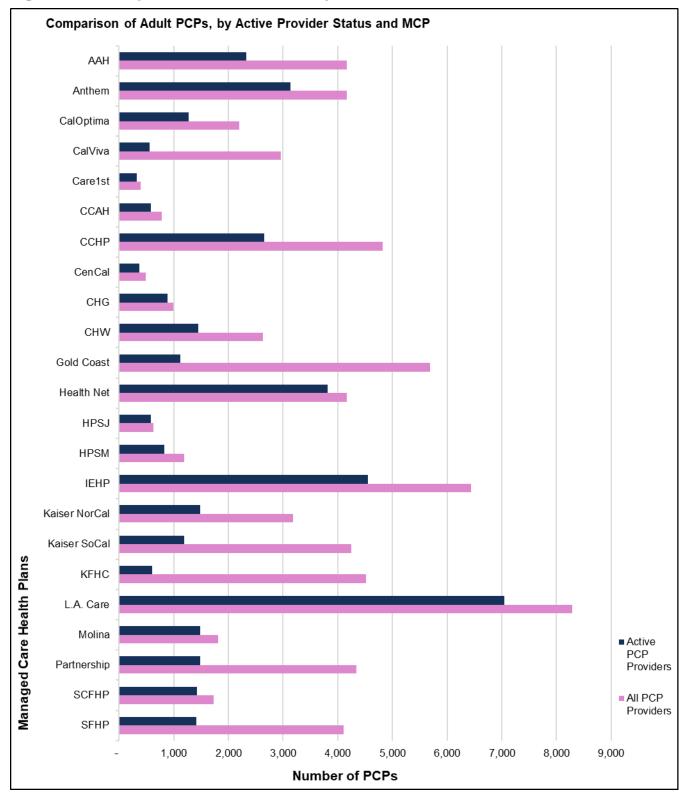

Figure 5.5—Comparison of Adult PCPs, by Active Provider Status and MCP

The key findings from Figure 5.5 are listed below:

- Although not presented in the figure, approximately 55 percent of all adult PCPs were active statewide.
- Health Net and HPSJ had the highest rate of active adult PCPs, with over 90 percent of all adult PCPs designated as active.
- KFHC had the lowest rate of active providers, followed by CalViva and Gold Coast.

Appendix B contains detailed MCP-specific and statewide provider counts for adult PCP providers, by active status.

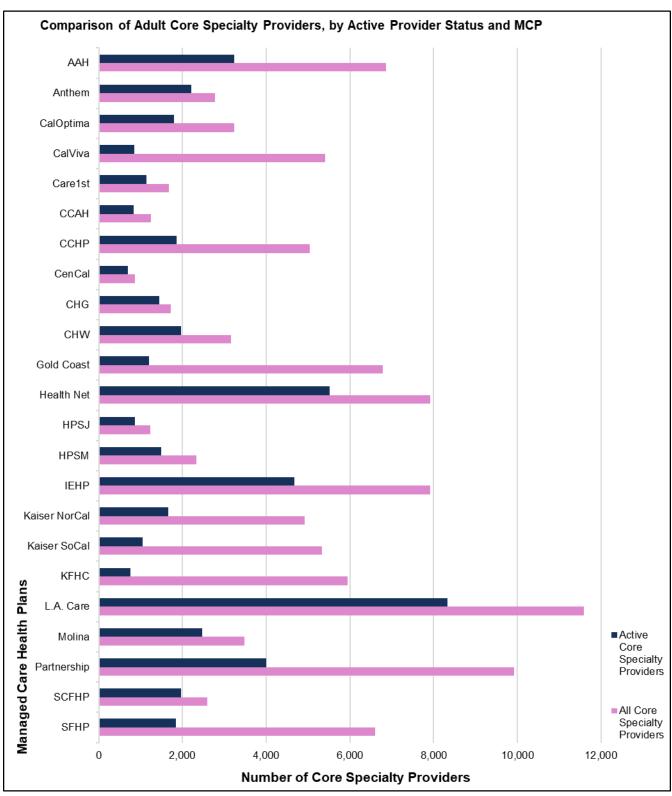

<u>Adult Core Specialists:</u> A detailed summary of provider counts for the adult core specialty providers is provided in Appendix B. The key findings from the summary provider counts, by adult core provider categories, are listed below:

- Mental health outpatient services providers represented the most commonly reported adult core specialist, covering approximately 28 percent of all reported specialties statewide.
   Obstetrics & gynecology was the second most commonly reported adult core specialist, covering about 12 percent of reported specialties.
- Endocrinology and infectious disease specialists were the least commonly reported specialty statewide, each representing about only 1 percent of all specialists reported statewide.
- Cardiology/interventional cardiology represented approximately 5 percent of statewide reported specialties, whereas about 23 percent of Anthem's reported specialists were cardiologists/interventional cardiologists, which was the highest reported frequency of this specialty provider.
- Anthem reported the highest frequencies of dermatology and orthopedic surgery providers, at approximately 13 percent and 14 percent, respectively. Conversely, Anthem reported the lowest percentage of OB/GYN specialists, at about 6 percent.
- Some MCPs reported multiple specialties for a given provider. IEHP reported the highest number of average specialties per provider.

Appendix B contains additional detail on the number of specialties per provider.

Figure 5.6 displays MCP-specific and statewide distribution of active adult core specialty providers.

Figure 5.6—Comparison of Adult Core Specialty Providers, by Active Provider Status and MCP

The key findings from Figure 5.6 are listed below:

- Although not presented in the figure, approximately 48 percent of adult core specialists reported were active statewide.
- CenCal and CHG had the highest number of active adult core specialists, with at least 80 percent of adult core specialists designated as active.
- CalViva, Gold Coast, KFHC, and Kaiser SoCal had the lowest number of active adult core specialists, all with less than 20 percent designated as active.

Appendix B contains detailed MCP-specific and statewide provider counts for adult core specialty providers, by active status.

<u>Pediatric PCPs:</u> Figure 5.7 displays MCP-specific and statewide distribution of pediatric PCP provider categories.

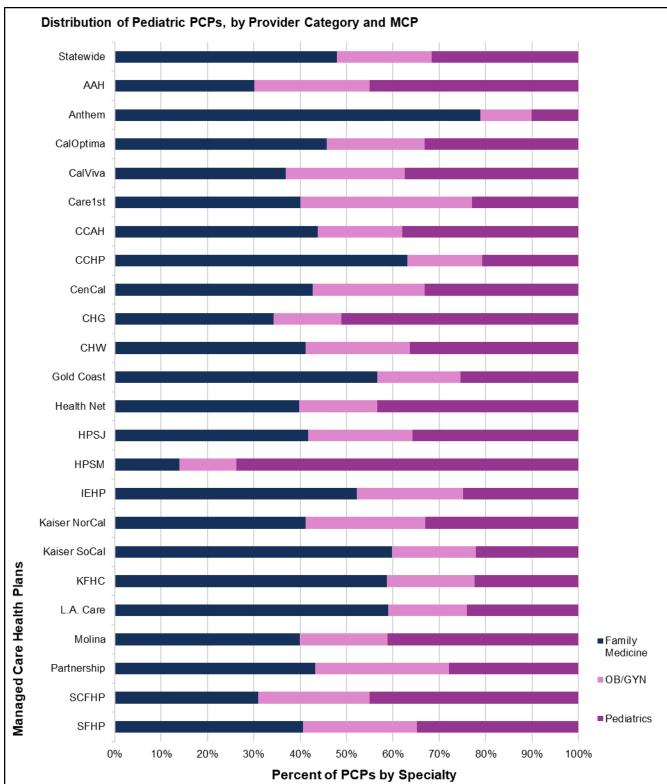

Figure 5.7—Distribution of Pediatric PCPs, by Provider Category and MCP

The key findings from Figure 5.7 are listed below:

- Family medicine comprised the majority of the pediatric PCP specialties assessed, representing 48 percent of all pediatric PCPs.
- No MCPs reported pediatric PCP preventive medicine specialists.
- HPSM reported the largest number of pediatric specialists, with about 74 percent of all pediatric PCPs being reported as a pediatric specialist. Conversely, HPSM also reported the smallest number of family medicine specialists, with 14 percent of all pediatric PCPs being reported as a family medicine specialist.
- Anthem reported that approximately 79 percent of pediatric PCPs were family medicine providers, representing the largest percentage across all MCPs. Conversely, about 10 percent of Anthem's reported PCPs were pediatric specialists, representing the smallest percentage across all MCPs.
- Care1st reported that approximately 37 percent of pediatric PCP providers specialized in obstetrics & gynecology, the only MCP to report more than 30 percent within this specialty.
- Some MCPs reported multiple specialties for a given provider. IEHP reported the highest number of average specialties per provider.

Appendix B contains additional detail on the number of specialties per provider as well as MCP-specific and statewide provider counts, by pediatric PCP provider categories.

While OB/GYN providers served a portion of the pediatric population, they likely were not providing services to the entire population. As such, HSAG also investigated the distribution of pediatric providers, excluding OB/GYN providers. Figure 5.8 displays MCP-specific and statewide distribution of pediatric PCP provider categories, excluding OB/GYN providers.

Figure 5.8—Distribution of Pediatric PCPs, by Provider Category and MCP, Excluding **OB/GYN Providers** 

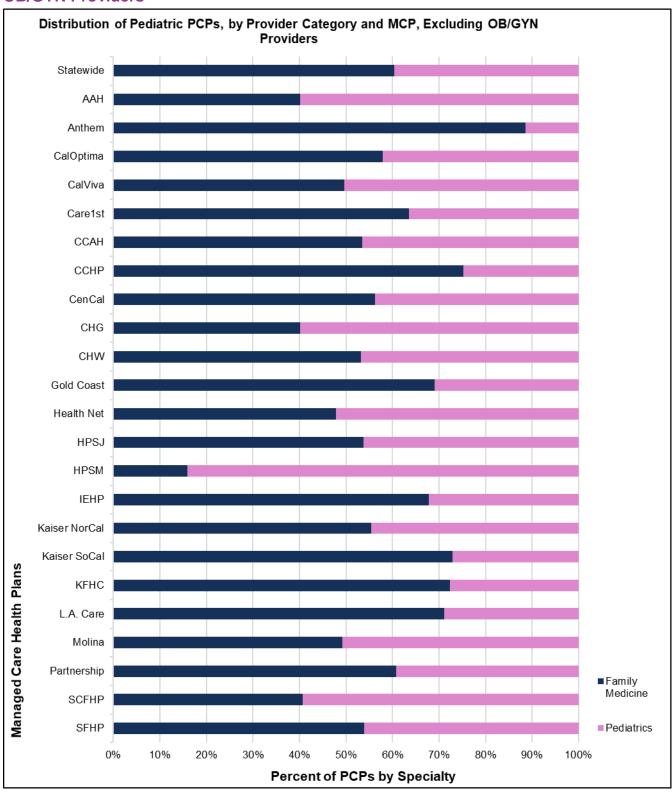

Figure 5.9 displays MCP-specific and statewide distribution of active pediatric PCP providers.

Figure 5.9—Comparison of Pediatric PCPs, by Active Provider Status and MCP

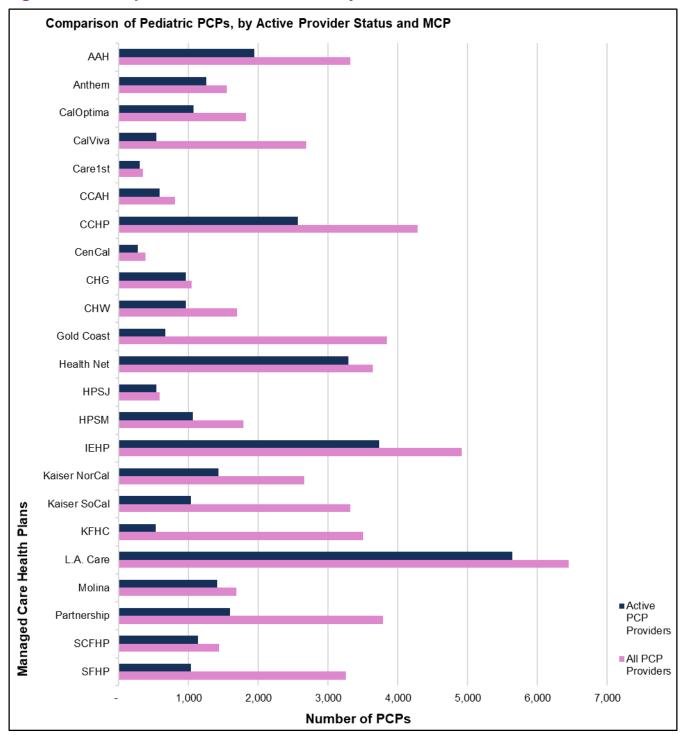

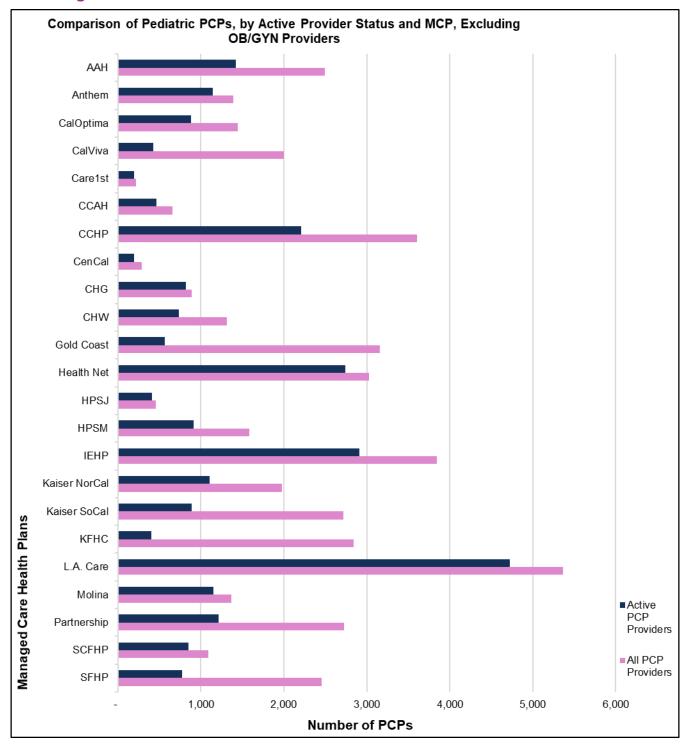

Figure 5.10 displays MCP-specific and statewide distribution of active pediatric PCP providers, excluding OB/GYN providers.

Figure 5.10—Comparison of Pediatric PCPs, by Active Provider Status and MCP, **Excluding OB/GYN Providers** 

The key findings from Figure 5.9 and Figure 5.10 are listed below:

- Statewide, the percentages of active pediatric PCP providers both with and without OB/GYN providers were comparable, at approximately 57 and 58 percent, respectively.
- Gold Coast and KFHC consistently had the lowest active rates both with and without OB/GYN providers. For both MCPs, less than 20 percent of pediatric PCPs were designated as active.
- CHG, Health Net, and HPSJ had the highest active rates when including OB/GYN providers, each with active rates greater than 90 percent. When OB/GYN providers were excluded, the same MCPs, with the addition of Care1st, had active rates greater than 90 percent.

Appendix B contains detailed MCP-specific and statewide provider counts for pediatric PCP providers, by active status.

<u>Pediatric Core Specialists:</u> A detailed summary of provider counts for the pediatric core specialty providers is provided in Appendix B. The key findings from the summary provider counts, by pediatric core provider categories, are listed below:

- Of the pediatric core specialists assessed, obstetrics & gynecology was the most commonly reported specialty, representing about 66 percent of all reported specialists.
- HPSM reported approximately 13 percent of providers had a cardiology/interventional cardiology specialty. HPSM was the only MCP to report more than 10 percent of providers for this specialty.
- Anthem reported six pediatric specialty types, the fewest across all MCPs. Additionally, Anthem was the only MCP that did not report any pediatric gastroenterologists, nephrologists, or pulmonologists.
- ♦ HPSJ was the only MCP that did not report any pediatric general surgeons.
- All MCPs reported specialists for cardiology/interventional cardiology, endocrinology, hematology & oncology, obstetrics & gynecology, and psychiatry.
- The physical medicine & rehabilitation pediatric specialty was the least represented across MCPs, with only 11 MCPs reporting providers for this specialty.
- Some MCPs reported multiple specialties for a given provider. IEHP reported the highest average number of specialties per provider.

Appendix B contains additional details on the number of specialties per provider.

Figure 5.11 and Figure 5.12 display MCP-specific and statewide distribution of active pediatric core specialists, including and excluding OB/GYN providers, respectively.

Figure 5.11—Comparison of Pediatric Core Specialists, by Active Provider Status and **MCP** 

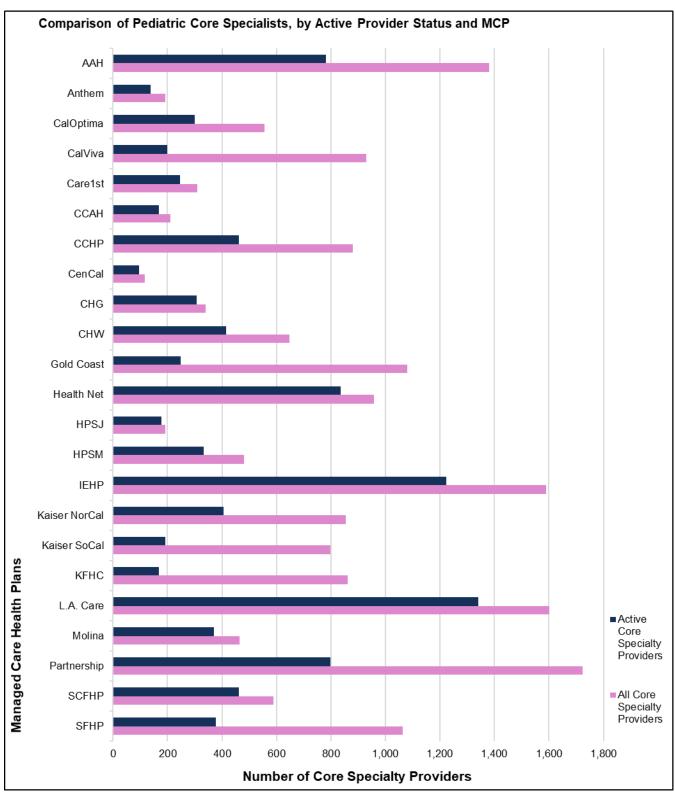

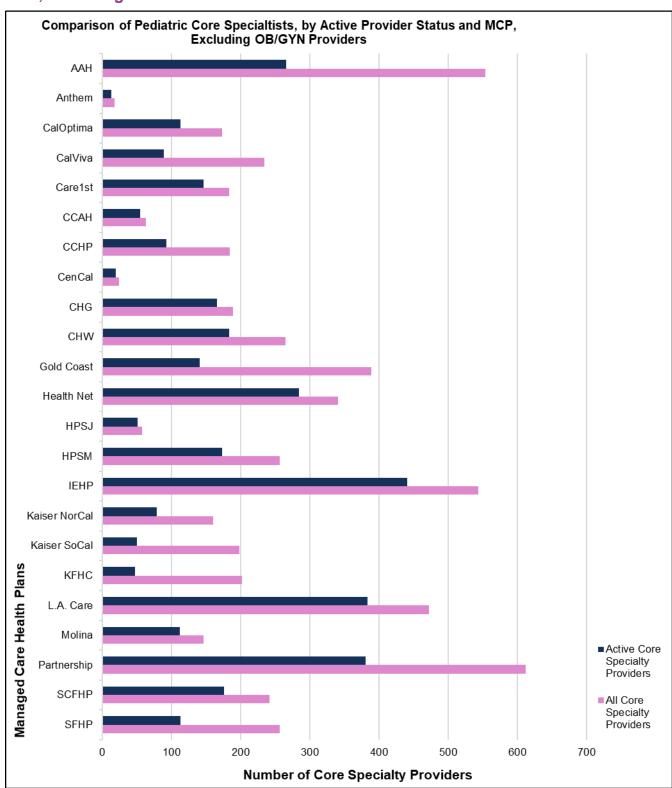

Figure 5.12—Comparison of Pediatric Core Specialists, by Active Provider Status and MCP, Excluding OB/GYN Providers

The key findings from Figure 5.11 and Figure 5.12 are listed below:

- Although not shown in the figures, the percentages of active pediatric core specialists statewide were similar both with and without OB/GYN providers. Including OB/GYN providers, approximately 56 percent of reported pediatric specialists were active, compared to approximately 62 percent when excluding OB/GYN providers.
- CHG and HPSJ consistently had the highest percentage of active pediatric specialists, with more than 90 percent of assessed pediatric specialists designated as active. Excluding OB/GYN providers, the same MCPs, plus CCAH, had at least 87 percent of pediatric providers active.
- CalViva, Gold Coast, KFHC, and Kaiser SoCal had the lowest active rates, with less than 25 percent of pediatric specialists active when including OB/GYN providers. Excluding OB/GYN providers, only KFHC and Kaiser SoCal had an active rate less than 30 percent.

Appendix B contains detailed MCP-specific and statewide provider counts for pediatric core specialty providers, by active status.

<u>Facility-Based and Specialty Providers:</u> Table 5.1 displays MCP-specific and statewide distribution of facility-based and specialty providers.

Table 5.1—Distribution of Facility-Based and Specialty Providers, by Provider Category and MCP

Statewide	1.57%	6.17%	6.23%	6.81%	65.83%	0.24%	1.85%	11.30%

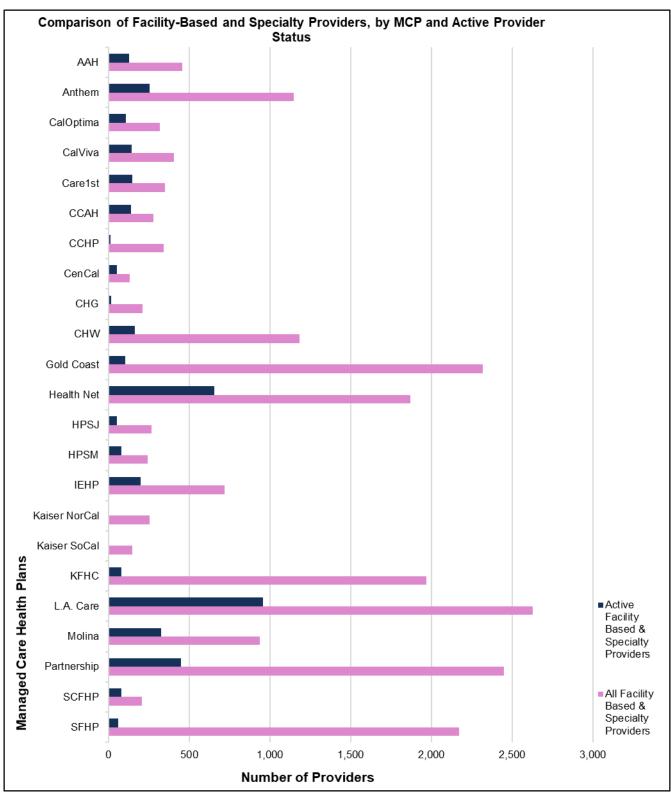

The key findings from Table 5.1 are listed below:

- Of the facility-based and specialty providers assessed, outpatient hospital represented the most commonly reported category at approximately 66 percent. However, CCHP, Kaiser NorCal, and Kaiser SoCal all reported 15 percent or less of their facility-based and specialty providers as outpatient hospital.
- CHG reported the highest percentage of FQHC at approximately 26 percent.
- Of the 10 MCPs that reported ICFs, eight reported three or fewer.
- Kaiser SoCal reported the largest percentage of inpatient hospital at approximately 69 percent, which is much higher than the statewide average of approximately 7 percent.
- Some MCPs report multiple specialties for a given provider. Anthem reported the highest average number of specialties per provider.

Appendix B contains additional detail on the number of specialties per provider as well as MCP-specific and statewide provider counts for facility-based and specialty providers, by MCP and active status.

Figure 5.13 displays MCP-specific and statewide distribution of active facility-based and specialty providers.

Figure 5.13—Comparison of Facility-Based and Specialty Providers, by MCP and Active **Status** 

The key findings from Figure 5.13 are listed below:

- Although not displayed in the figure, approximately 20 percent of reported facility-based and specialty providers were active statewide.
- CCAH had the highest rate of active facility-based and specialty providers, at approximately 51 percent. CCAH was the only MCP with more than 50 percent of reported facility-based and specialty providers active.
- Kaiser NorCal, Kaiser SoCal, and SFHP had the lowest rates of facility-based and specialty providers active, with active rates less than 3 percent.

Appendix B contains detailed MCP-specific and statewide provider counts for facility-based and specialty providers, by MCP and active status.

Figure 5.14 shows the comparison between two different methodologies to determine all adult and pediatric PCPs, by MCP and active status. One method used the PCP flag, which MCPs used to flag providers who met PCP criteria. The second method used agreed-upon taxonomy codes that defined adult and pediatric PCPs.

Comparison of Active PCPs Using PCP Flag and Taxonomy, by MCP AAH Anthem CalOptima CalViva Care1st CCAH CCHP CenCal CHG CHW Gold Coast Health Net **HPSJ HPSM IEHP** Kaiser NorCal Kaiser SoCal Managed Care Health Plans KFHC L.A. Care Molina Partnership ■ Active PCP (PCP Flag) **SCFHP** ■ Active PCP **SFHP** (Taxonomy) 0 1,000 2,000 3,000 4,000 5,000 6,000 7,000 8,000 9,000 **Number of Providers** 

Figure 5.14—Comparison of Active PCPs Using PCP Flag and Taxonomy, by MCP

The key finding from Figure 5.14 is listed below:

◆ For all MCPs except L.A. Care, more active PCPs were identified using taxonomy codes than using the PCP flag. L.A. Care had 400 more active PCPs identified using the PCP flag than using taxonomy codes.

Additionally, as presented in Appendix B (Table B.23), HSAG performed a comparison of facility-based and specialty providers, by active status and MCP. The key findings are listed below:

- All MCPs excluding CCHP, CHW, Gold Coast, SCFHP, and SFHP had higher active rates for PCPs identified using the PCP flag than PCPs identified using taxonomy codes.
- Except for CalOptima and CalViva, MCPs had comparable active rates across PCPs identified using the PCP flag and using the taxonomy codes. For both these MCPs, a considerably lower active rate was found when identifying PCPs using taxonomy codes.

#### **Provider Penetration Rate**

HSAG used provider 274 data provided by DHCS and the CMB data to develop a summary of the provider penetration rate statewide. Specifically, HSAG investigated the percentage of medical providers (i.e., medical doctors [MDs] or osteopathic doctors [DOs]) within the State of California who were contracted with at least one MCP. Due to limitations of the two datasets and the inability to link providers by medical license ID, HSAG only assessed provider penetration rates at the statewide level, not by MCP. Additionally, due to limitations and lack of alignment with the way provider specialties were collected in the provider 274 data and the CMB data, HSAG limited this analysis to a statewide summary of all medical providers in lieu of analyses by provider category.

Table 5.2 displays the percentage of medical providers licensed by the CMB that contract with at least one MCP.

Table 5.2—Percentage of Licensed CMB Providers That Contracted with at Least One MCP, by Active Status

MCP	MCP Enrolled Providers	Enrolled Providers		MCP Enrolled Providers (%)	MCP Active Providers (%)
Statewide	74,970	63,285	117,697	63.7%	53.8%

The key findings from Table 5.2 are listed below:

 Of all medical providers licensed with the CMB, approximately 64 percent were contracted with at least one MCP.  Of the medical providers licensed with the CMB, approximately 54 percent were actively providing services to beneficiaries of at least one MCP.

### **Provider-to-Beneficiary Ratios**

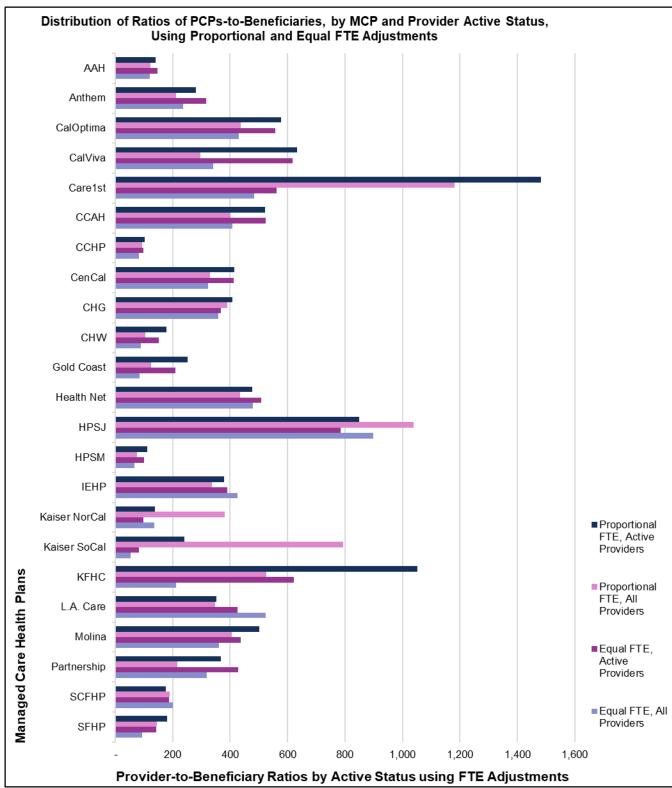

To assess the capacity of the MCPs' provider networks, HSAG calculated the provider-to-beneficiary ratios for PCPs and all physicians and the PCP to NP and PA ratios. The results presented here are based on December 2017 data. Different methodologies were used to identify PCPs and total physicians, but only PCPs and total physicians identified via taxonomy codes are presented here. Results for additional mechanisms to identify PCPs are available upon request. HSAG assessed the changes in provider counts over time but did not note substantial changes over time.<sup>25</sup> Note that the graphs represent the ratio of the number of providers to the number of beneficiaries. Thus, smaller values represent greater provider availability and access.

Figure 5.15 displays the distribution of ratios of PCPs-to-beneficiaries, by MCP and by provider active status, using proportional and equal FTE adjustments.

—Draft Copy for Review—

<sup>&</sup>lt;sup>25</sup> Trend results are available upon request.

Figure 5.15—Distribution of Ratios of PCPs-to-Beneficiaries, by MCP and Provider **Active Status, Using Proportional and Equal FTE Adjustments** 

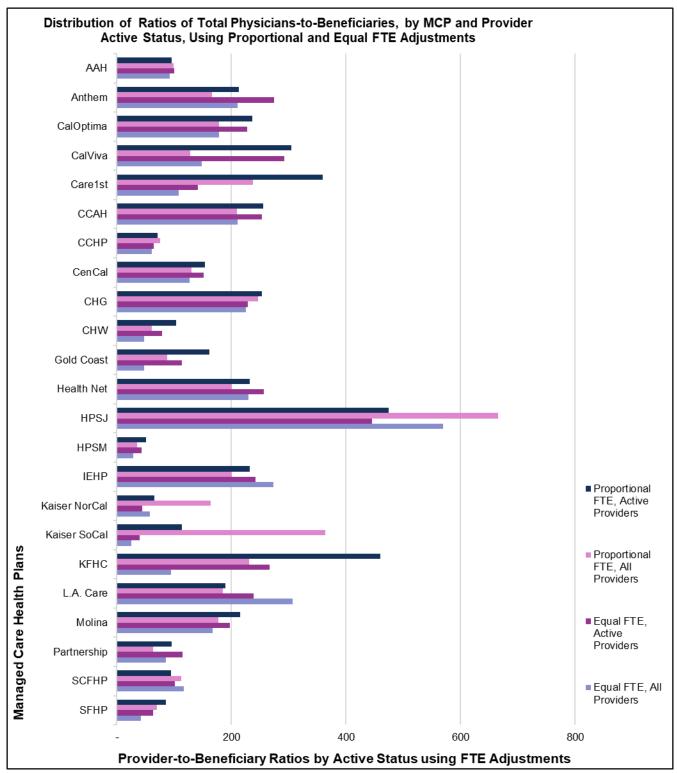

The key findings from Figure 5.15 are listed below:

- Regardless of the ratio type and a PCP's active status, all MCPs met the standard of one PCP to 2,000 beneficiaries.
- Care1st had the highest proportional adjustment ratio for all PCPs and for active PCPs, at approximately one PCP to 1,180 beneficiaries and one active PCP to 1,483 beneficiaries, respectively.
- HPSM had the lowest proportional adjustment for all PCPs, at approximately one PCP to 76 beneficiaries. Kaiser SoCal had the lowest equal FTE adjustment ratio for all PCPs, at approximately one PCP to 55 beneficiaries.
- CCHP, HPSM, and Kaiser NorCal had the lowest ratios for equal FTE adjustment for active PCPs, at approximately one active PCP to 100 beneficiaries.
- CCHP had the lowest ratio for proportional adjustment for active PCPs, at approximately one PCP to 103 beneficiaries.

Appendix B contains detailed MCP-specific and statewide ratios of PCPs-to-beneficiaries for proportional and equal FTE adjustments, as well as unadjusted ratios, by PCP taxonomy and PCP flag.

Figure 5.16 displays the distribution of ratios of total physicians-to-beneficiaries, by MCP and by provider active status, using proportional and equal FTE adjustments.

Figure 5.16—Distribution of Ratios of Total Physicians-to-Beneficiaries, by MCP and Provider Active Status, Using Proportional and Equal FTE Adjustments

The key findings from Figure 5.16 are listed below:

- Regardless of the ratio type and a physician's active status, all MCPs met the standard of one physician to 1,200 beneficiaries.
- Kaiser SoCal and HPSM had the lowest ratios for equal FTE adjustment for both all and active physicians. For all physicians, the ratio was one physician to about 25 beneficiaries and one physician to about 29 beneficiaries, respectively. For active physicians, the ratio was one physician to about 40 beneficiaries and one physician to about 43 beneficiaries, respectively.
- HPSM also had the lowest ratios for proportional adjustments for both all and active physicians. The ratios were one physician to about 35 beneficiaries and one active physician to about 51 beneficiaries.
- HPSJ had the highest ratio for equal FTE adjustment for both all and active physicians. For all physicians, the ratio was one physician to about 569 beneficiaries; for active physicians, the ratio was one physician to about 445 beneficiaries.
- HPSJ also had the highest ratios for proportional adjustments for both all and active physicians. For all physicians, the ratio was one physician to about 665 beneficiaries; for active physicians, the ratio was one physician to about 474 beneficiaries.

Appendix B contains detailed MCP-specific and statewide ratios of total physicians-tobeneficiaries for proportional and equal FTE adjustments, as well as unadjusted ratios and total physicians determined by MD license.

Table 5.3 displays the ratios of PCPs and total physicians-to-beneficiaries for active status providers, using proportional and equal FTE adjustments.

Table 5.3—Ratios of PCPs and Total Physicians-to-Beneficiaries for Active Status Providers, Using Proportional and Equal FTE Adjustments

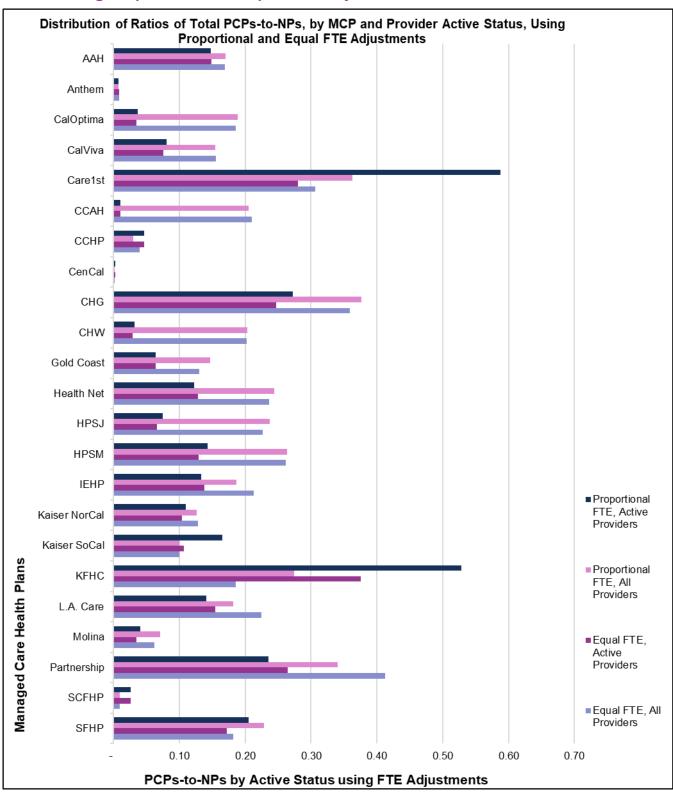

Provider Category	Rural	Small	Medium	Large		
Primary Care Physicians (PCP flag)						
Equal FTE Adjustment	350.14	691.28	529.89	383.11		
Proportional Adjustment	370.30	744.45	615.80	365.75		
Primary Care Physicians (taxonomies)						
Equal FTE Adjustment	281.95	456.72	341.39	308.89		
Proportional Adjustment	326.99	493.81	390.59	291.17		
All Physicians (taxonomies)						
Equal FTE Adjustment	111.83	217.51	165.22	170.90		
Proportional Adjustment	131.22	246.45	183.97	158.31		
All Physicians (MD license)						
Equal FTE Adjustment	102.70	215.62	164.57	162.74		
Proportional Adjustment	135.47	237.27	188.71	149.99		

The key finding from Table 5.3 is listed below:

 Regardless of the ratio type (equal FTE or proportional adjustment), type of physician, or how the physicians are identified, the ratio of PCPs or all physicians to beneficiaries is highest for small urbanicity regions.

Figure 5.17 displays the distribution of ratios of total PCPs-to-NPs, by MCP and by provider active status, using proportional and equal FTE adjustments.

Figure 5.17—Distribution of Ratios of Total PCPs-to-NPs, by MCP and Provider Active Status, Using Proportional and Equal FTE Adjustments

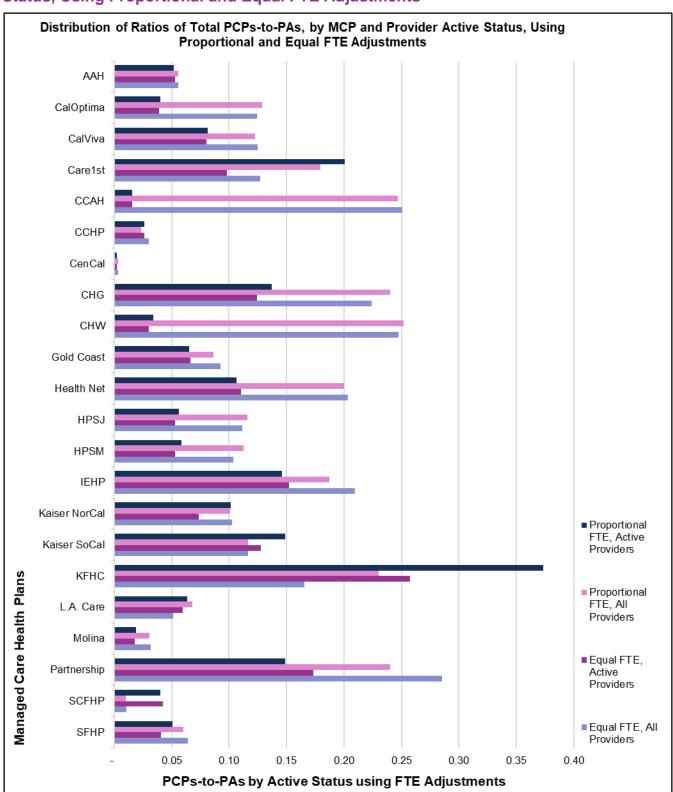

The key findings from Figure 5.17 are listed below:

- Regardless of the ratio type and a provider's active status, all MCPs met the standard of one PCP to four NPs.
- ◆ The number of PCPs is substantially larger than the number of NPs across all MCPs. All PCP-to-NP ratios were one PCP to approximately 0.6 nurse practitioners or less.
- There were very minimal changes between proportional and equal FTE adjustment ratios for both all and active providers.
- Although there were minimal changes across the different ratio analyses, active provider ratios for both equal FTE and proportional adjustments tended to be slightly better, with 19 and 18 MCPs, respectively, having a ratio of one PCP to 0.2 NPs or less. This is compared to equal FTE and proportional adjustments both having 14 MCPs with a ratio of one PCP to 0.2 NPs or less when looking at all providers.

Appendix B contains detailed MCP-specific and statewide ratios of PCPs-to-NPs for proportional and equal FTE adjustments, as well as unadjusted ratios.

Figure 5.18 displays the distribution of ratios of total PCPs-to-PAs, by MCP and by provider active status, using proportional and equal FTE adjustments.

Figure 5.18—Distribution of Ratios of Total PCPs-to-PAs, by MCP and Provider Active **Status, Using Proportional and Equal FTE Adjustments** 

The key findings from Figure 5.18 are listed below:

- Regardless of the ratio type and a provider's active status, all MCPs met the standard of one PCP to no more than four PAs. Anthem was the only MCP that did not report any PAs, which still meets the standard of no more than four.
- ♦ The number of PCPs is substantially larger than the number of PAs across all MCPs. All PCP-to-PA ratios were one PCP to approximately 0.4 PAs or less.
- There were very minimal changes between proportional and equal FTE adjustment ratios for both all and active providers.
- Although there were minimal changes across the different ratio analyses, active provider ratios for both equal FTE and proportional adjustments tended to be slightly better than all PCPs, both having 21 MCPs with a ratio of one PCP to 0.2 PAs or less. This is compared to equal FTE and proportional adjustment ratios both having 17 MCPs with a ratio of one PCP to 0.2 PAs or less when looking at all providers.

Appendix B contains detailed MCP-specific and statewide ratios of PCPs-to-PAs for proportional and equal FTE adjustments, as well as unadjusted ratios, by PCP taxonomy and PCP flag.

Table 5.4 displays the ratios of PCPs to non-physician medical practitioners for active status providers, using proportional and equal FTE adjustments.

Table 5.4—Ratios of PCPs-to-Non-Physician Medical Practitioners for Active Status Providers, Using Proportional and Equal FTE Adjustments

Provider Category	Rural	Small	Medium	Large		
Nurse Practitioners (PCP flag)						
Equal FTE Adjustment	0.17	0.16	0.17	0.14		
Proportional Adjustment	0.18	0.16	0.19	0.14		
Nurse Practitioners (taxonomies)						
Equal FTE Adjustment	0.12	0.10	0.11	0.11		
Proportional Adjustment	0.14	0.10	0.11	0.11		
Physician Assistants (PCP flag)						
Equal FTE Adjustment	0.15	0.16	0.14	0.07		
Proportional Adjustment	0.16	0.15	0.15	0.07		
Physician Assistants (taxonomies)						
Equal FTE Adjustment	0.10	0.10	0.09	0.06		
Proportional Adjustment	0.12	0.10	0.09	0.06		

The key findings from Table 5.4 are listed below:

- The ratio of PCPs to non-physician medical practitioners was very small for both NPs and PAs, regardless of whether the equal or proportional method of FTE adjustment was used or whether PCPs were identified using the PCP flag or taxonomy codes.
- Generally, the ratio of PCPs to non-physician medical practitioners was lower in the large urbanicity regions compared to other urbanicity regions, likely due to the greater number of PCPs in these regions.

## **Beneficiary and Provider Urbanicity Distribution**

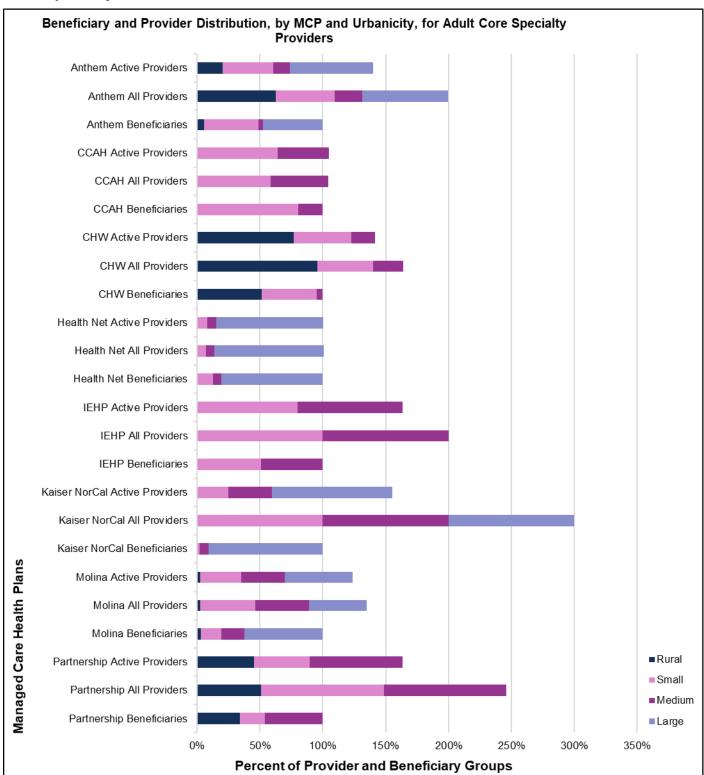

HSAG used beneficiary enrollment data and provider 274 data provided by DHCS to identify the proportion of an MCP's beneficiaries who reside in a region with a given level of urbanicity as well as the proportion of providers practicing in a region with a given level of urbanicity. A side-by-side comparison of the relative distribution of beneficiaries and providers across varying levels of urbanicity can provide high-level indications of where providers are less prevalent and where access to care may be limited.

The results of such comparisons are not conclusive; they should only be interpreted as suggestive and should only be used as possible indicators of where additional research and investigation may be necessary to identify possible provider access issues. Direct comparisons between beneficiary and provider urbanicity distributions can be problematic when an MCP codes a significant portion of providers as providing services across multiple—and sometimes all—regions served by the MCP. In some cases, this multiple-region coding may accurately reflect that a provider allocates his or her time equally across multiple urbanicity regions, but in other cases claim and encounter data do not support this interpretation. To minimize the effect of multiple-region coding in the provider 274 data, HSAG assigned providers to MCP regions for which services had been actively provided as evidenced by the existence of a claim or encounter in that MCP region.

The figures below display comparative distributions of beneficiary and active adult PCP providers for only the plans that serve regions that demonstrate diverse urbanicity. A table showing the distribution of beneficiary urbanicities, by MCP, can be found in Appendix B.

Figure 5.19 displays the sum of the percentage of beneficiaries, active adult core specialty providers, and all adult core specialty providers associated with each urbanicity area. Values significantly greater than 100 percent indicate a large number of providers providing services across multiple urbanicities. All beneficiaries in the enrollment data are associated with a single urbanicity.

Figure 5.19—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Adult **Core Specialty Providers** 

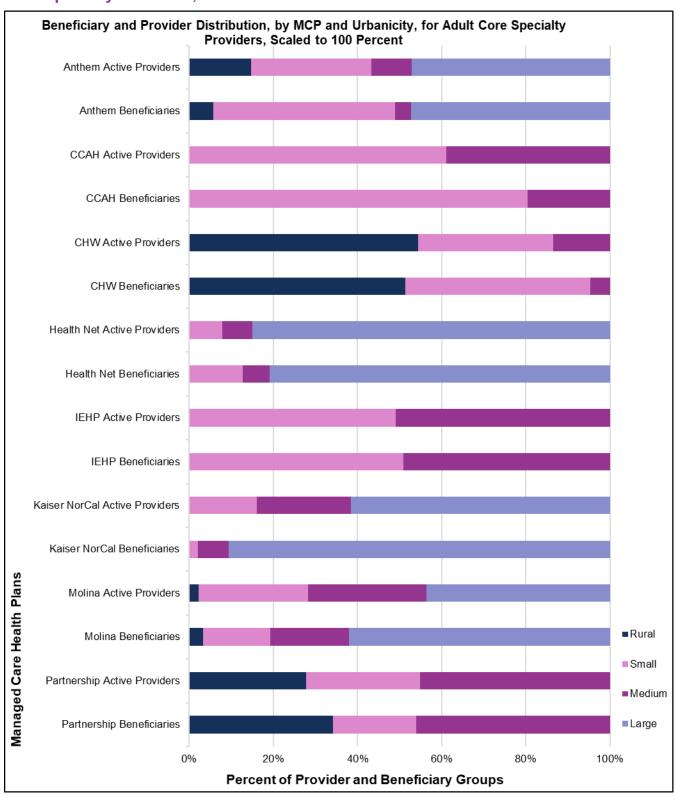

The key findings from Figure 5.19 are listed below:

- Anthem, CHW, IEHP, Kaiser NorCal, Molina, and Partnership demonstrated a large number of both active adult core specialty providers and all adult core specialty providers providing care in multiple urbanicities as indicated by values totaling more than 100 percent.<sup>26</sup>
- The number of urbanicity regions per provider was demonstrably greater for all adult core specialty providers compared to active adult core specialty providers for Anthem, Kaiser NorCal, and Partnership.
- CCAH and Health Net demonstrated few adult core specialty providers practicing across multiple urbanicities.

Figure 5.20 shows the distribution of beneficiaries and active adult core specialty providers for each multiple-urbanicity plan.

<sup>&</sup>lt;sup>26</sup> Values significantly greater than 100 percent indicate a large number of providers providing services across multiple urbanicities. All beneficiaries in the enrollment data are associated with a single urbanicity.

Figure 5.20—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Adult Core Specialty Providers, Scaled to 100 Percent

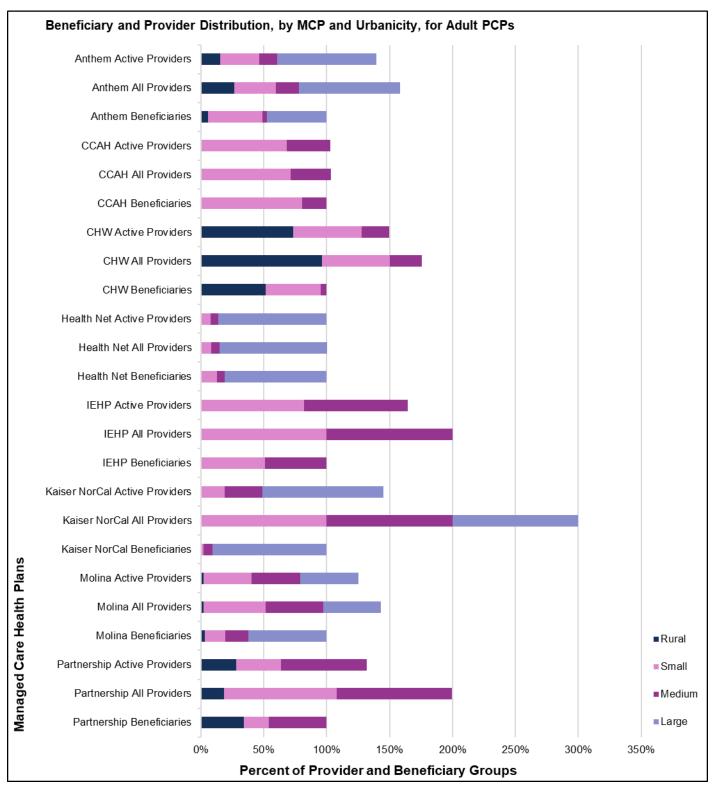

The key findings from Figure 5.20 are listed below:

- While the number of urbanicity regions per provider was relatively high for Anthem, CHW, IEHP, and Partnership, the distribution of urbanicity for beneficiaries was comparable to that of active adult core specialty providers.
- For CCAH, there was a greater proportion of beneficiaries in small urbanicity areas compared to active facility-based and specialty providers.
- Health Net demonstrated a comparable distribution of urbanicity for beneficiaries and active adult core specialty providers.
- For MCPs that had reasonably reliable data, as measured by displaying few providers practicing across multiple urbanicities, a slightly greater proportion of providers were located in the more densely populated areas.

Figure 5.21 displays the sum of the percentage of beneficiaries, active adult PCPs, and all adult PCPs associated with each urbanicity area. Values significantly greater than 100 percent indicate a large number of providers providing services across multiple urbanicities. All beneficiaries in the enrollment data are associated with a single urbanicity.

Figure 5.21—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Adult **PCPs** 

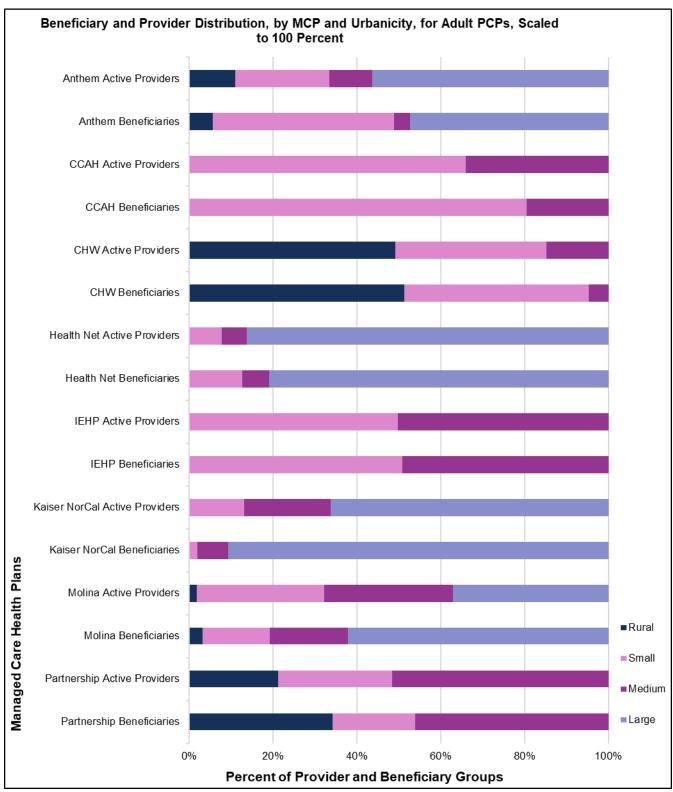

The key findings from Figure 5.21 are listed below:

- Anthem, CHW, IEHP, Kaiser NorCal, Molina, and Partnership demonstrated a large number of both active adult PCPs and all adult PCPs providing care in multiple urbanicities as indicated by values totaling more than 100 percent.
- Additionally, the number of urbanicity regions per provider was demonstrably greater for all adult PCPs compared to active adult PCPs for CHW, Kaiser NorCal, and Partnership.
- CCAH and Health Net demonstrated few adult PCPs practicing across multiple urbanicities.

Figure 5.22 shows the distribution of beneficiaries and active adult PCPs for each multipleurbanicity plan.

Figure 5.22—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Adult PCPs, Scaled to 100 Percent

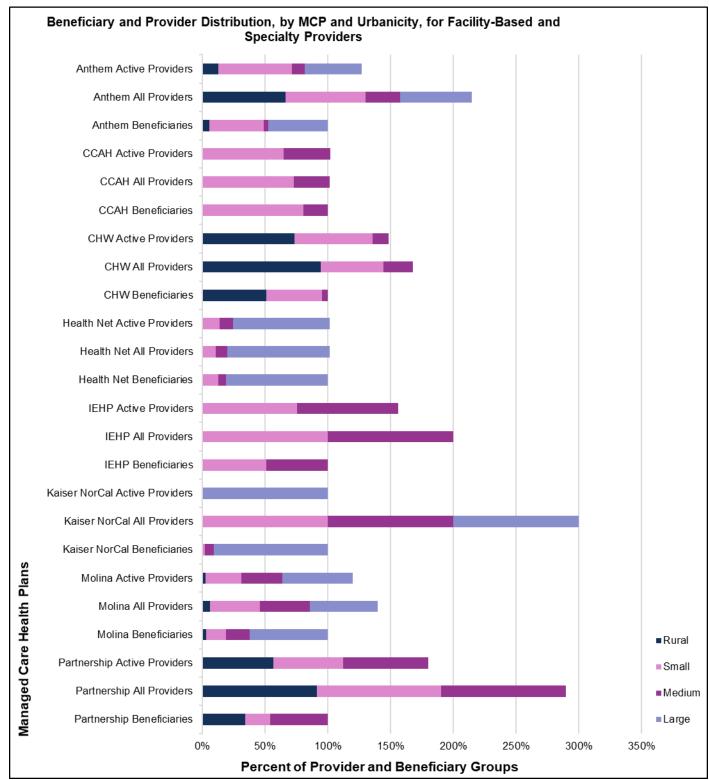

The key findings from Figure 5.22 are listed below:

- While the number of urbanicity regions per provider was relatively high, the distribution of urbanicity for beneficiaries was comparable to that of active adult PCPs for CHW, IEHP, and Partnership.
- ◆ There was a greater proportion of CCAH beneficiaries in small urbanicity areas compared to active facility-based and specialty providers.
- Health Net demonstrated a comparable distribution of urbanicity for beneficiaries and active adult PCPs.
- For MCPs that had reasonably reliable data, as measured by displaying few providers practicing across multiple urbanicities, a slightly greater proportion of providers were located in the more densely populated areas.

Figure 5.23 displays the sum of the percentage of beneficiaries, active facility-based and specialty providers, and all facility-based and specialty providers associated with each urbanicity area. Values significantly greater than 100 percent indicate a large number of providers providing services across multiple urbanicities. All beneficiaries in the enrollment data were associated with a single urbanicity.

Figure 5.23—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Facility-**Based and Specialty Providers** 

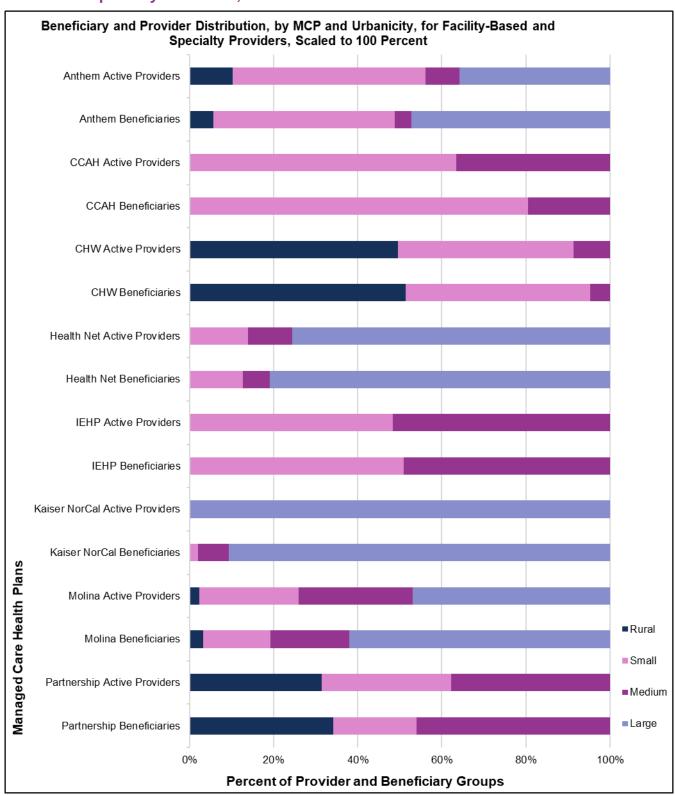

The key findings from Figure 5.23 are listed below:

- Anthem, CHW, IEHP, Molina, and Partnership demonstrated a large number of both active facility-based and specialty providers and all facility-based and specialty providers providing care in multiple urbanicities as indicated by values totaling more than 100 percent.
- The number of urbanicity regions per provider was demonstrably greater for all facilitybased and specialty providers compared to active facility-based and specialty providers among Anthem, IEHP, Kaiser NorCal, and Partnership.
- CCAH and Health Net demonstrated few facility-based and specialty providers practicing across multiple urbanicities.
- Kaiser NorCal demonstrated few facility-based and specialty providers practicing across multiple urbanicities and a large number of all facility-based and specialty providers practicing across multiple urbanicities.

Figure 5.24 shows the distribution of beneficiaries and active facility-based and specialty providers for each multiple-urbanicity plan.

Figure 5.24—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Facility-**Based and Specialty Providers, Scaled to 100 Percent** 

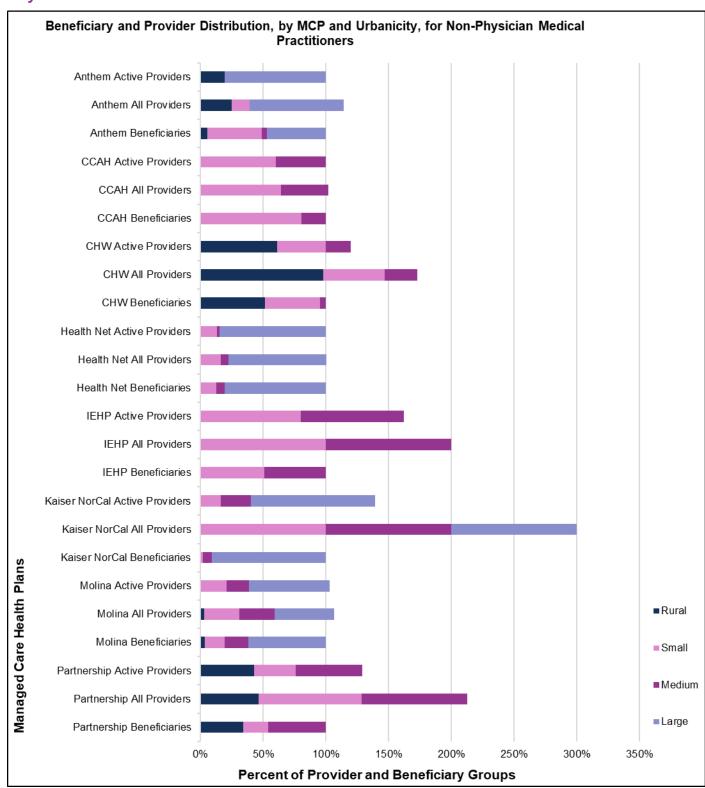

The key findings from Figure 5.24 are listed below:

- While the number of urbanicity regions per provider was relatively high, the distribution of urbanicity for beneficiaries was comparable to that of active facility-based and specialty providers for Anthem, CHW, IEHP, and Partnership.
- There was a greater proportion of CCAH beneficiaries in small urbanicity areas compared to active facility-based and specialty providers.
- Health Net demonstrated a comparable distribution of urbanicity for beneficiaries and active facility-based and specialty providers.
- All active facility-based and specialty providers for Kaiser NorCal were in large urbanicity areas, whereas the urbanicity distribution for beneficiaries showed a small proportion in both small and medium urbanicities.
- Where differences were observed, MCPs that had reasonably reliable data, as measured by displaying few providers practicing across multiple urbanicities, generally displayed a slightly greater proportion of providers in the more densely populated areas.

Figure 5.25 displays the sum of the percentages of beneficiaries, active non-physician medical practitioners, and all non-physician medical practitioner providers associated with each urbanicity area. Values significantly greater than 100 percent indicate a large number of providers providing services across multiple urbanicities. All beneficiaries in the enrollment data are associated with a single urbanicity.

Figure 5.25—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Non-**Physician Medical Practitioners** 

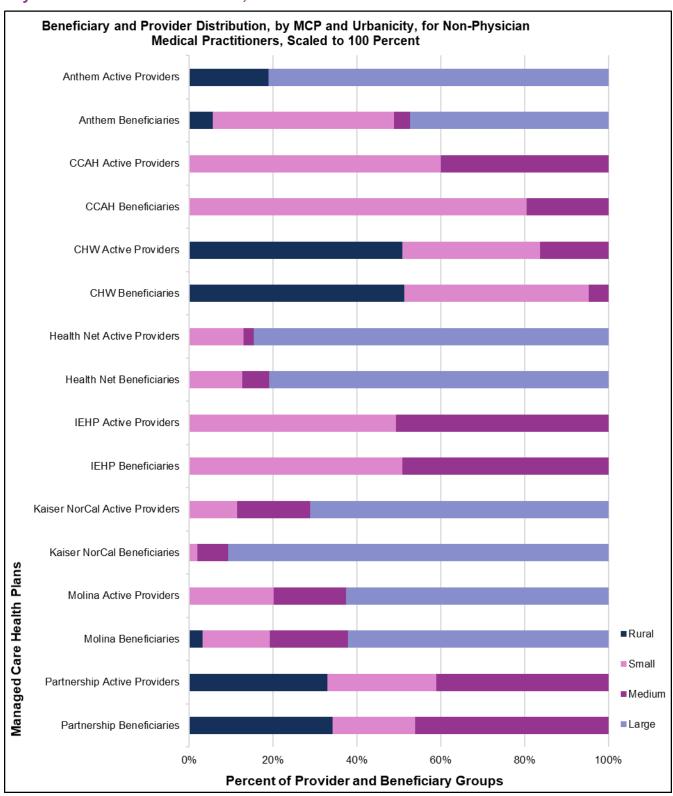

The key findings from Figure 5.25 are listed below:

- CHW, IEHP, Kaiser NorCal, and Partnership demonstrated a large number of both active non-physician medical practitioners and all non-physician medical practitioners providing care in multiple urbanicities as indicated by values totaling more than 100 percent.
- Additionally, the number of urbanicity regions per provider was demonstrably greater for all non-physician medical practitioners compared to active non-physician medical practitioners for CHW, Kaiser NorCal, and Partnership.
- CHW, IEHP, Kaiser NorCal, and Partnership demonstrated a large number of both active non-physician medical practitioners and all non-physician medical practitioners providing care in multiple urbanicities.
- Anthem, CCAH, Health Net, and Molina demonstrated few non-physician medical practitioners practicing across multiple urbanicities.

Figure 5.26 shows the distribution of beneficiaries and active non-physician medical practitioners for each multiple-urbanicity plan.

Figure 5.26—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Non-**Physician Medical Practitioners, Scaled to 100 Percent** 

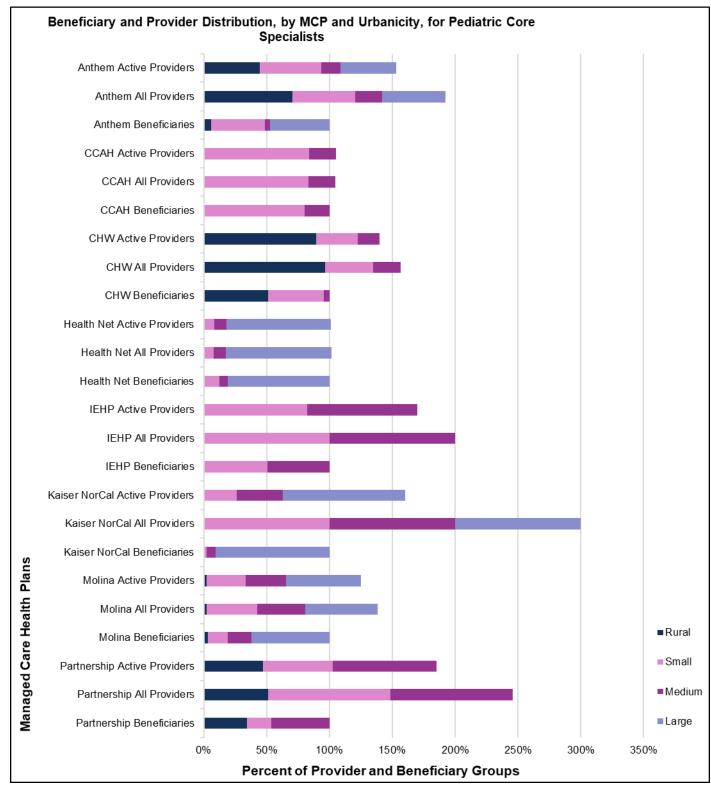

The key findings from Figure 5.26 are listed below:

- While the number of urbanicity regions per provider was relatively high, the distribution of urbanicity for beneficiaries was comparable to that of active non-physician medical practitioners for CHW, IEHP, and Partnership.
- Health Net and Molina demonstrated comparable distributions of urbanicity for beneficiaries and active non-physician medical practitioners, while Anthem and CCAH demonstrated differing distributions of urbanicity for beneficiaries and active non-physician medical practitioners.
- For the MCPs that had reasonably reliable data, as measured by showing few practitioners providing care across multiple urbanicities, a greater proportion of non-physician medical practitioners were located in the more densely populated areas.

Figure 5.27 displays the sum of the percentages of beneficiaries, active pediatric core specialists, and all pediatric core specialists associated with each urbanicity area. Values significantly greater than 100 percent indicate that a large number of providers were providing services across multiple urbanicities. All beneficiaries in the enrollment data were associated with a single urbanicity.

Figure 5.27—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Pediatric **Core Specialists** 

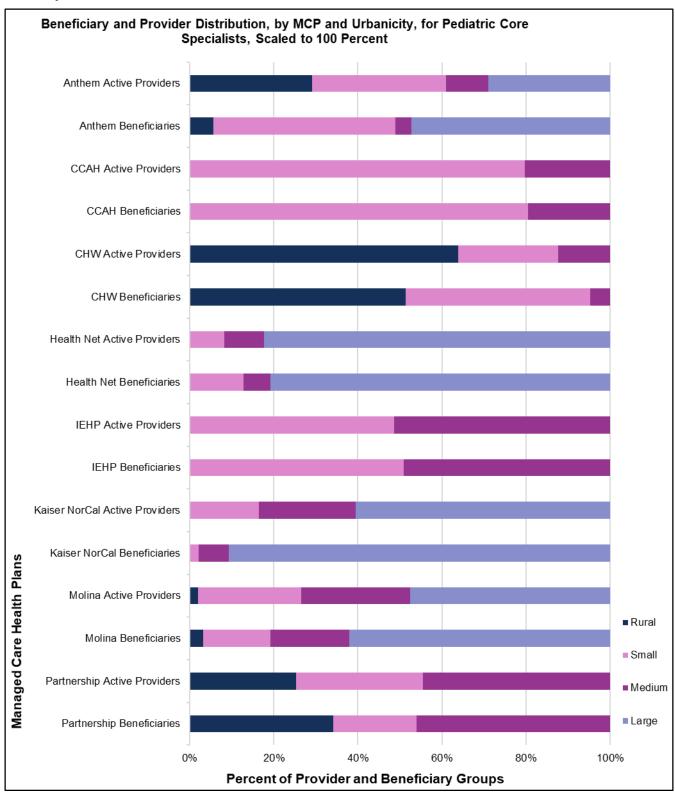

The key findings from Figure 5.27 are listed below:

- Anthem, CHW, IEHP, Kaiser NorCal, Molina, and Partnership demonstrated a large number of both active pediatric core specialists and all pediatric core specialists providing care in multiple urbanicities as indicated by values totaling more than 100 percent.
- Additionally, the number of urbanicity regions per provider was demonstrably greater for all pediatric core specialists compared to active pediatric core specialists for Anthem, Kaiser NorCal, and Partnership.
- CCAH and Health Net demonstrated few pediatric core specialists practicing across multiple urbanicities.
- For MCPs that had reasonably reliable data, as measured by displaying few providers practicing across multiple urbanicities, a slightly greater proportion of providers were located in the less densely populated areas.

Figure 5.28 shows the distribution of beneficiaries and active pediatric core specialists for each multiple-urbanicity plan.

Figure 5.28—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Pediatric **Core Specialists, Scaled to 100 Percent** 

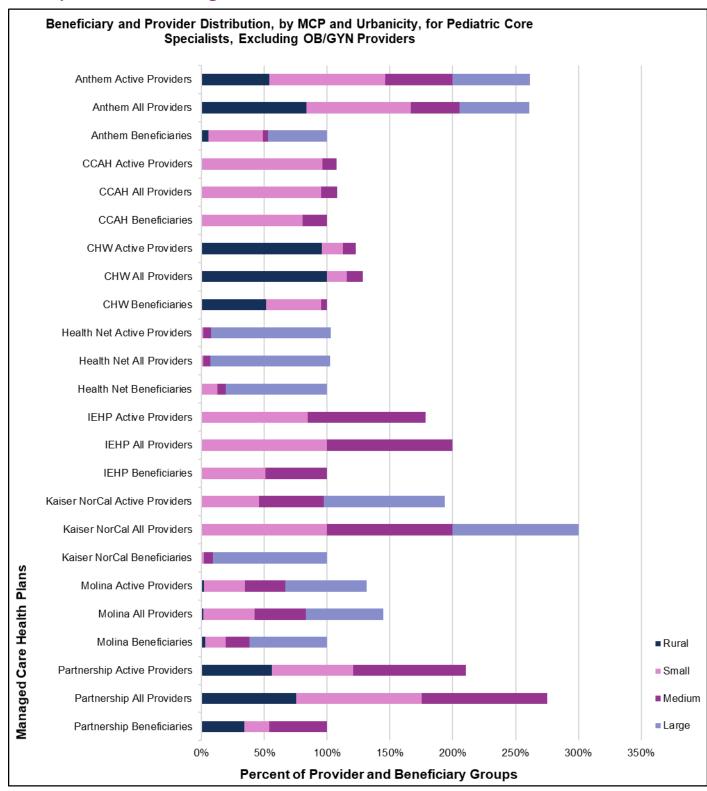

The key findings from Figure 5.28 are listed below:

- While the number of urbanicity regions per provider was relatively high, the distribution of urbanicity for beneficiaries was comparable to that of active pediatric core specialists for CHW, IEHP, and Partnership.
- CCAH and Health Net demonstrated comparable distributions of urbanicity for beneficiaries and active pediatric core specialists.
- For MCPs that had reasonably reliable data, as measured by displaying few providers practicing across multiple urbanicities, a slightly greater proportion of providers were located in the less densely populated areas.

Figure 5.29 displays the sum of the percentages of beneficiaries, active pediatric core specialists (excluding OB/GYN providers), and all pediatric core specialists (excluding OB/GYN providers) associated with each urbanicity area. Values significantly greater than 100 percent indicate a large number of providers providing services across multiple urbanicities. All beneficiaries in the enrollment data were associated with a single urbanicity.

Figure 5.29—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Pediatric Core Specialists, Excluding OB/GYN Providers

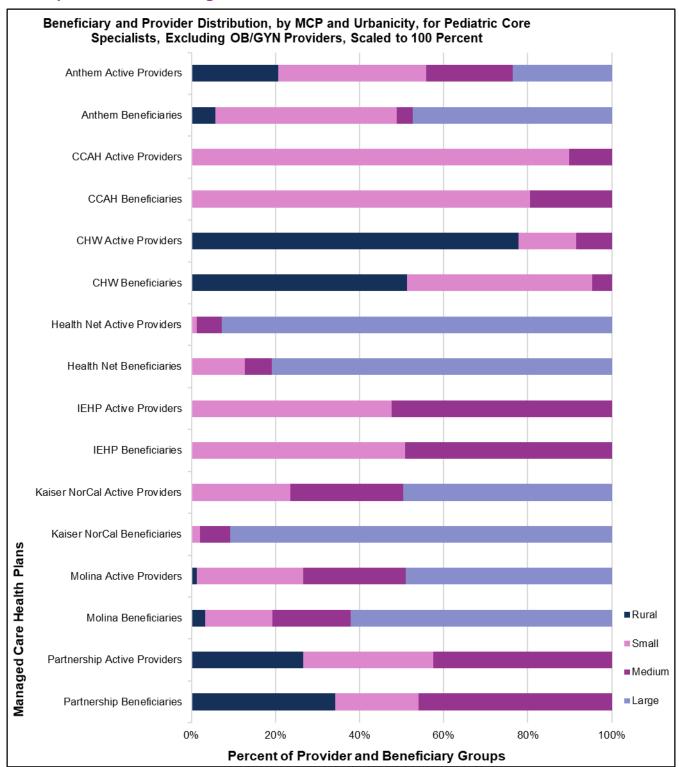

The key findings from Figure 5.29 are listed below:

- Anthem, IEHP, Kaiser NorCal, Molina, and Partnership demonstrated a large number of both active pediatric core specialists (excluding OB/GYN providers) and all pediatric core specialists (excluding OB/GYN providers) providing care in multiple urbanicities as indicated by values totaling more than 100 percent.
- Additionally, the number of urbanicity regions per provider was demonstrably greater for all pediatric core specialists (excluding OB/GYN providers) compared to active pediatric core specialists (excluding OB/GYN providers) among Kaiser NorCal and Partnership.
- CCAH, CHW, and Health Net demonstrated few pediatric core specialists (excluding OB/GYN providers) practicing across multiple urbanicities.

Figure 5.30 shows the distribution of beneficiaries and active pediatric core specialists (excluding OB/GYN providers) for each multiple-urbanicity plan.

Figure 5.30—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Pediatric Core Specialists, Excluding OB/GYN Providers, Scaled to 100 Percent

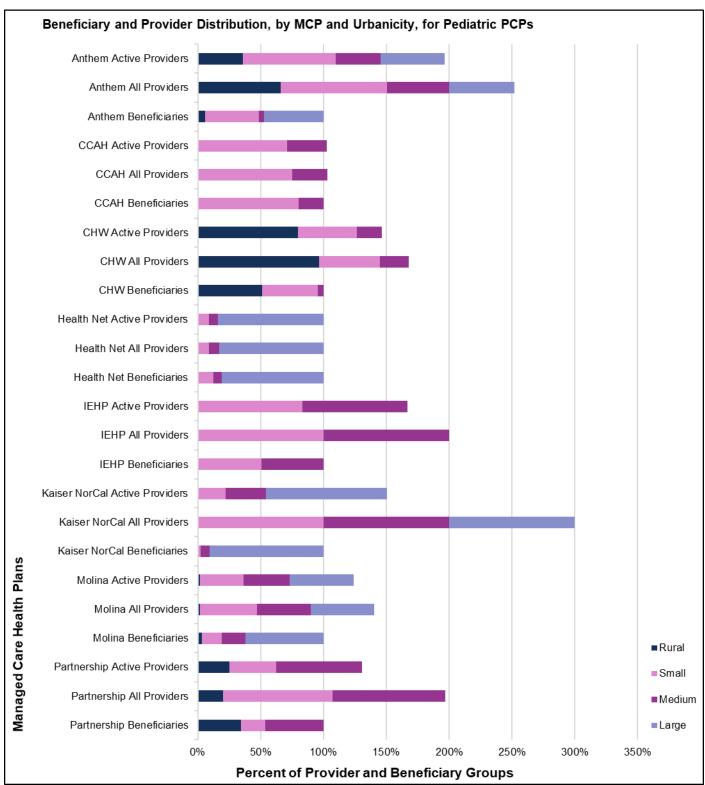

The key findings from Figure 5.30 are listed below:

- While the number of urbanicity regions per provider was relatively high, the distribution of urbanicity for beneficiaries was comparable to that of active pediatric core specialists (excluding OB/GYN providers) for IEHP and Partnership.
- CCAH demonstrated a comparable distribution of urbanicity for beneficiaries and active pediatric core specialists (excluding OB/GYN providers), while CHW and Health Net demonstrated differing distributions of urbanicity for beneficiaries and active pediatric core specialists (excluding OB/GYN providers).
- For MCPs that had reasonably reliable data, as measured by displaying few providers practicing across multiple urbanicities, an even greater proportion of providers were located in the less densely populated areas than when including OB/GYN providers.

Figure 5.31 displays the sum of the percentages of beneficiaries, active pediatric PCPs, and all pediatric PCPs associated with each urbanicity area. Values significantly greater than 100 percent indicate a large number of providers providing services across multiple urbanicities. All beneficiaries in the enrollment data were associated with a single urbanicity.

Figure 5.31—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Pediatric **PCPs** 

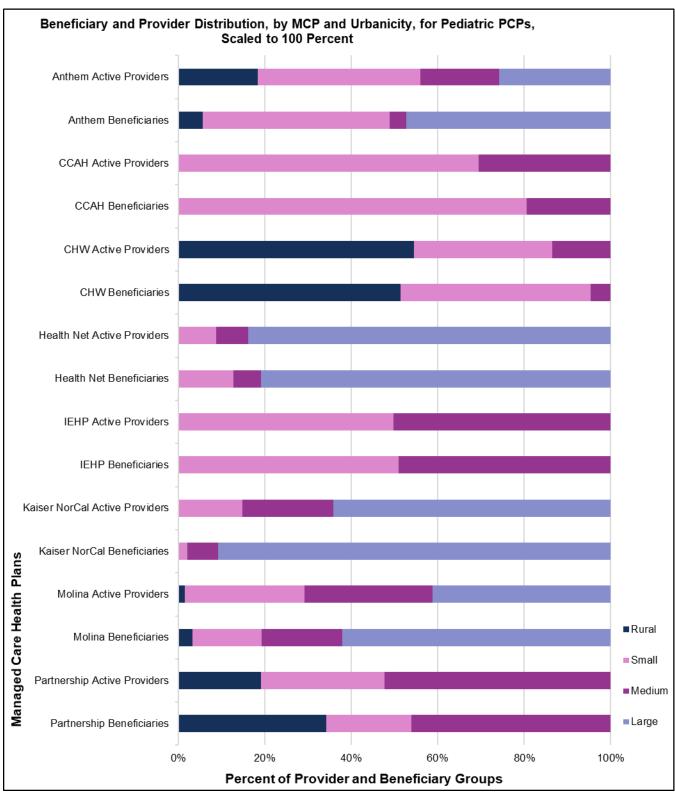

The key findings from Figure 5.31 are listed below:

- Anthem, CHW, IEHP, Kaiser NorCal, Molina, and Partnership demonstrated a large number of both active pediatric PCPs and all pediatric PCPs providing care in multiple urbanicities as indicated by values totaling more than 100 percent.
- Additionally, the number of urbanicity regions per provider was demonstrably greater for all pediatric PCPs compared to active pediatric PCPs for Anthem, Kaiser NorCal, and Partnership.
- CCAH and Health Net demonstrated few pediatric PCPs practicing across multiple urbanicities.

Figure 5.32 shows the distribution of beneficiaries and active pediatric PCPs for each multipleurbanicity plan.

Figure 5.32—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Pediatric PCPs, Scaled to 100 Percent

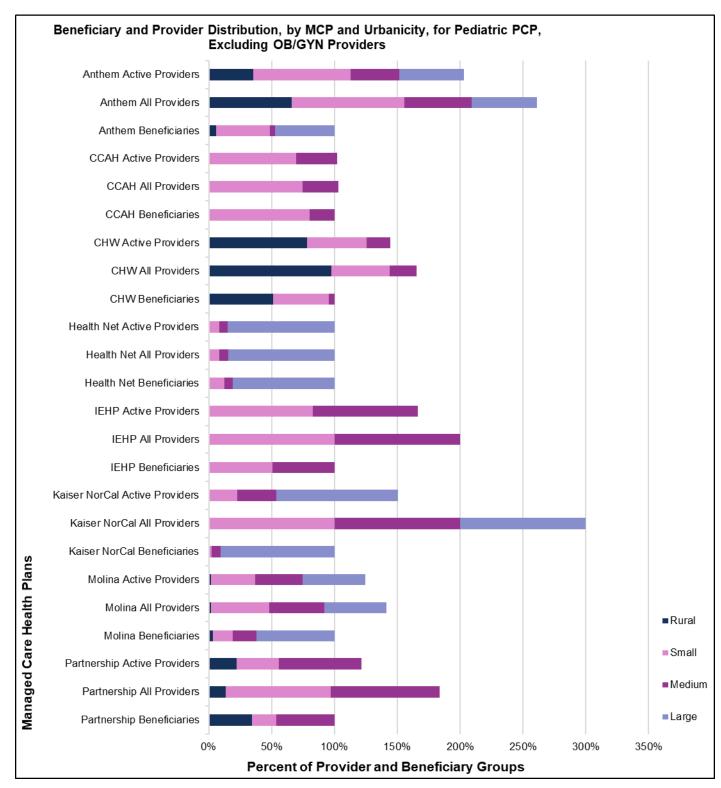

The key findings from Figure 5.32 are listed below:

- While the number of urbanicity regions per provider was relatively high, the distribution of urbanicity for beneficiaries was comparable to that of active pediatric PCPs for CHW and IEHP.
- CCAH and Health Net demonstrated comparable distributions of urbanicity for beneficiaries and active pediatric PCPs.
- For MCPs that had reasonably reliable data, as measured by displaying few providers practicing across multiple urbanicities, a slightly greater proportion of providers were located in the less densely populated areas.

Figure 5.33 displays the sum of the percentages of beneficiaries, active pediatric PCPs (excluding OB/GYN providers), and all pediatric PCPs (excluding OB/GYN providers) associated with each urbanicity area. Values significantly greater than 100 percent indicate a large number of providers providing services across multiple urbanicities. All beneficiaries in the enrollment data were associated with a single urbanicity.

Figure 5.33—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Pediatric PCPs, Excluding OB/GYN Providers

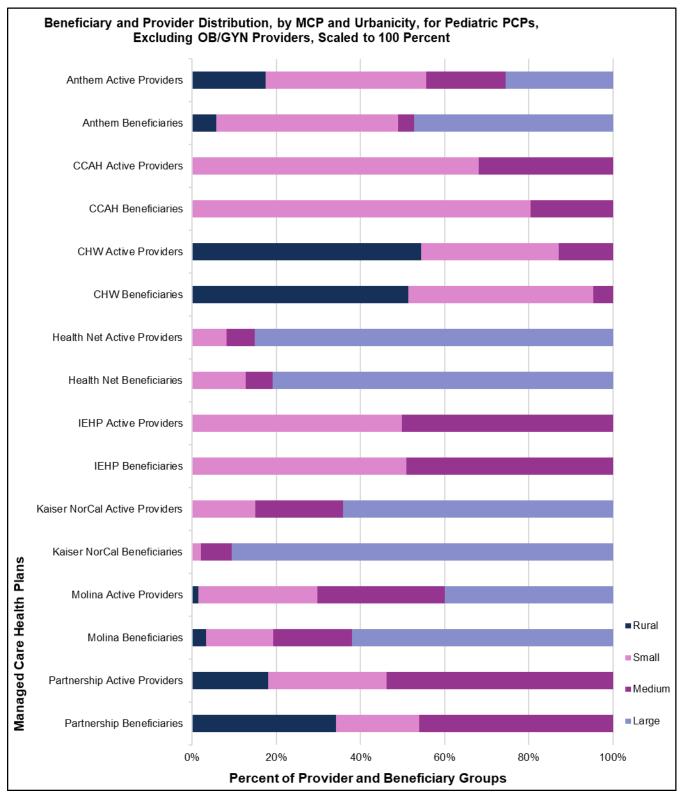

The key findings from Figure 5.33 are listed below:

- Anthem, CHW, IEHP, Kaiser NorCal, Molina, and Partnership demonstrated a large number of both active pediatric PCPs (excluding OB/GYN providers) and all pediatric PCPs (excluding OB/GYN providers) providing care in multiple urbanicities as indicated by values totaling more than 100 percent.
- Additionally, the number of urbanicity regions per provider was demonstrably greater for all pediatric PCPs (excluding OB/GYN providers) compared to active pediatric PCPs (excluding OB/GYN providers) for Anthem, Kaiser NorCal, and Partnership.
- CCAH and Health Net demonstrated few providers practicing across multiple urbanicities.

Figure 5.34 shows the distribution of beneficiaries and active pediatric PCPs (excluding OB/GYN providers) for each multiple-urbanicity plan.

Figure 5.34—Beneficiary and Provider Distribution, by MCP and Urbanicity, for Pediatric PCPs, Excluding OB/GYN Providers, Scaled to 100 Percent

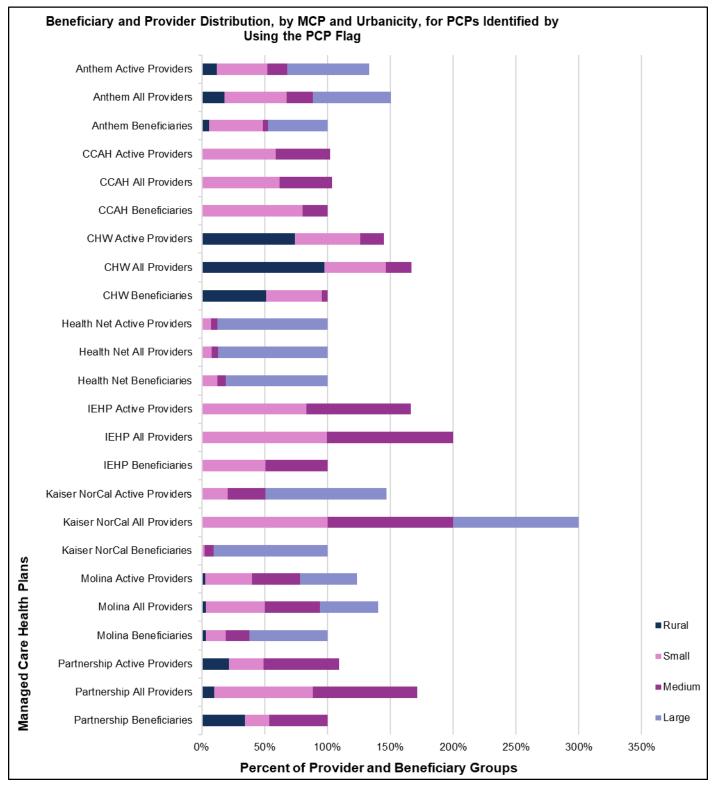

The key findings from Figure 5.34 are listed below:

- While the number of urbanicity regions per provider was relatively high, the distribution of urbanicity for beneficiaries was comparable to that of active pediatric PCPs (excluding OB/GYN providers) for CHW and IEHP.
- CCAH and Health Net demonstrated comparable distributions of urbanicity for beneficiaries and active pediatric PCPs (excluding OB/GYN providers).
- For MCPs that had reasonably reliable data, as measured by displaying few providers
  practicing across multiple urbanicities, an even greater proportion of providers were located
  in the less densely populated areas than when including OB/GYN providers.

Figure 5.35 displays the sum of the percentage of beneficiaries, active PCPs (identified using the PCP flag), and all PCPs (identified using the PCP flag) associated with each urbanicity area. Values significantly greater than 100 percent indicate a large number of providers providing services across multiple urbanicities. All beneficiaries in the enrollment data were associated with a single urbanicity.

Figure 5.35—Beneficiary and Provider Distribution, by MCP and Urbanicity, for PCPs Identified Using the PCP Flag

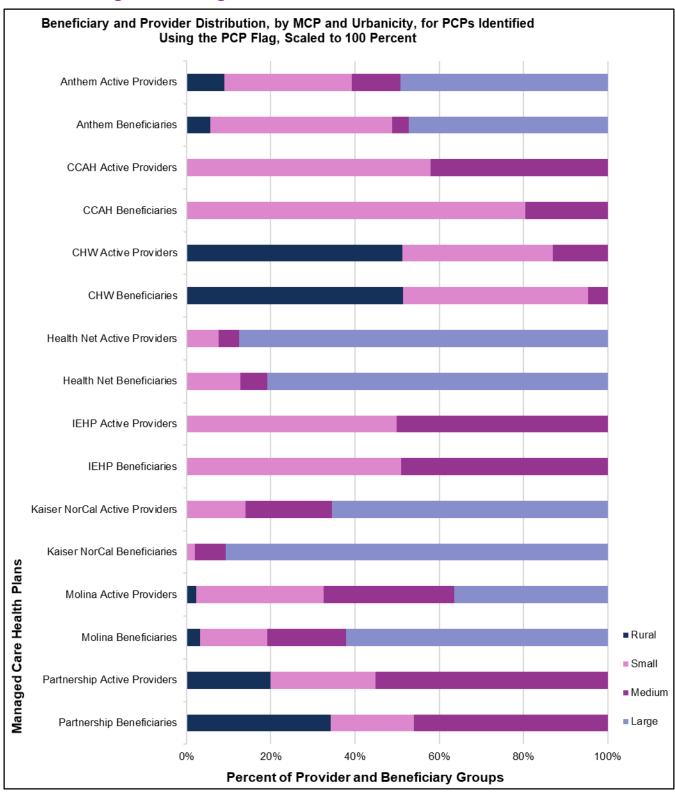

The key findings from Figure 5.35 are listed below:

- Anthem, CHW, IEHP, Kaiser NorCal, Molina, and Partnership demonstrated a large number of both active PCPs (identified using the PCP flag) and all PCPs (identified using the PCP flag) providing care in multiple urbanicities as indicated by values totaling more than 100 percent.
- Additionally, the number of urbanicity regions per provider was demonstrably greater for all PCPs (identified using the PCP flag) compared to active PCPs (identified using the PCP flag) for Kaiser NorCal and Partnership.
- CHW and Health Net demonstrated few PCPs (identified using the PCP flag) practicing across multiple urbanicities.

Figure 5.36 shows the distribution of beneficiaries and active PCPs (identified using the PCP flag) for each multiple-urbanicity plan.

Figure 5.36—Beneficiary and Provider Distribution, by MCP and Urbanicity, for PCPs Identified Using the PCP Flag, Scaled to 100 Percent

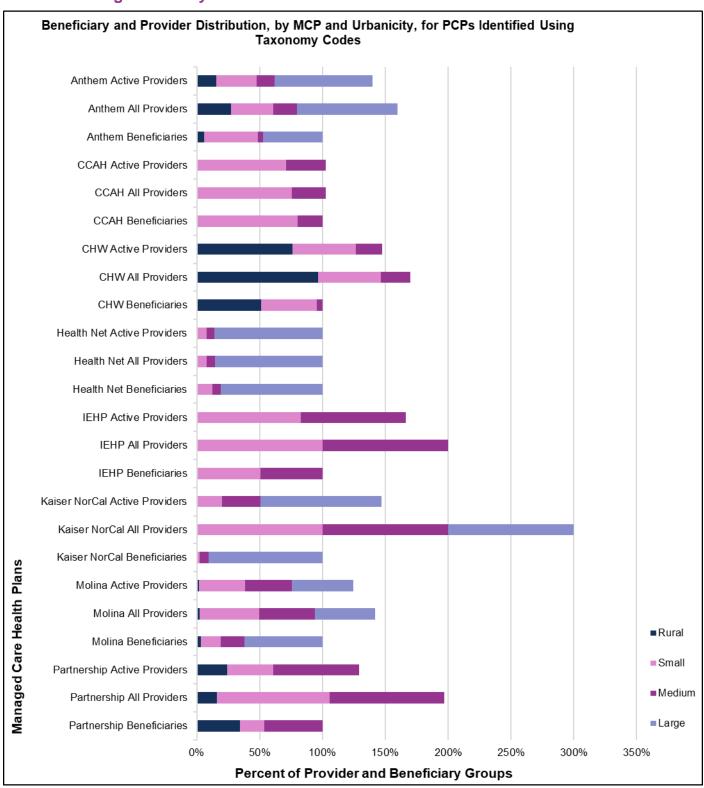

The key findings from Figure 5.36 are listed below:

- While the number of urbanicity regions per provider was relatively high, the distribution of urbanicity for beneficiaries was comparable to that of active PCPs (identified using the PCP flag) for Anthem, CHW, and IEHP.
- CHW and Health Net demonstrated comparable distributions of urbanicity for beneficiaries and active PCPs (identified using the PCP flag).
- Where differences were observed, the taxonomy code approach identified more PCP providers in the more densely populated areas of the State.

Figure 5.37 displays the sum of the percentages of beneficiaries, active PCPs (identified using taxonomy codes), and all PCPs (identified using taxonomy codes) associated with each urbanicity area. Values significantly greater than 100 percent indicate a large number of providers providing services across multiple urbanicities. All beneficiaries in the enrollment data were associated with a single urbanicity.

Figure 5.37—Beneficiary and Provider Distribution, by MCP and Urbanicity, for PCPs Identified Using Taxonomy Codes

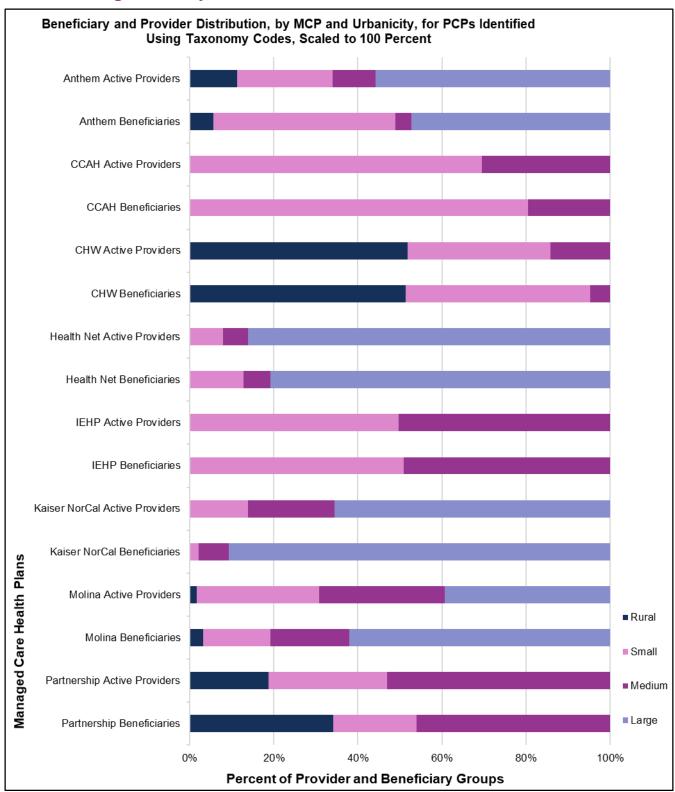

The key findings from Figure 5.37 are listed below:

- Anthem, CHW, IEHP, Kaiser NorCal, Molina, and Partnership demonstrated a large number of both active PCPs (identified using taxonomy codes) and all PCPs (identified using taxonomy codes) providing care in multiple urbanicities as indicated by values totaling more than 100 percent.
- Additionally, the number of urbanicity regions per provider was demonstrably greater for all PCPs (identified using taxonomy codes) compared to active PCPs (identified using taxonomy codes) for Kaiser NorCal and Partnership.
- CCAH and Health Net demonstrated few PCPs (identified using taxonomy codes) practicing across multiple urbanicities.

Figure 5.38 shows the distribution of beneficiaries and active PCPs (identified using taxonomy codes) for each multiple-urbanicity plan.

Figure 5.38—Beneficiary and Provider Distribution, by MCP and Urbanicity, for PCPs Identified Using Taxonomy Codes, Scaled to 100 Percent

The key findings from Figure 5.38 are listed below:

- While the number of urbanicity regions per provider was relatively high, the distribution of urbanicity for beneficiaries was comparable to that of active PCPs (identified using taxonomy codes) for CHW and IEHP.
- CCAH and Health Net demonstrated comparable distributions of urbanicity for beneficiaries and active PCPs (identified using taxonomy codes).
- Where differences were observed, the taxonomy code approach identified more PCP providers in the more densely populated areas of the State.

#### **Geographic Distribution**

#### Time/Distance Analyses—Compliance with Time/Distance Standards

HSAG used beneficiary and provider data provided by DHCS to assess the percentage of beneficiaries with access to PCP providers and hospitals within the KKA and MCMC time/distance standards of 15 miles/30 minutes and 10 miles/30 minutes, respectively. Results in this section present the general access to PCPs and hospitals for all beneficiaries across MCPs. The results presented here are based on December 2017 data. Shading is used to indicate when fewer than 99.0 percent of beneficiaries had access that met the time/distance standards.

Table 5.5 displays the percentage of MCMC adult and pediatric beneficiaries with access to PCPs and hospitals within MCMC time/distance standards, by MCP.

### Table 5.5—Percentage of Beneficiaries with Access to PCPs and Hospitals within MCMC Time/Distance Standards, by MCP

= Fewer than 99.0 percent of beneficiaries had access to the provider group for the indicated MCP.

МСР	Adult PCP	Pediatric PCP	Pediatric PCP, Excluding OB/GYN	PCP (AII)	Hospital, Inpatient	Hospital, Outpatient

SFHP	99.9	99.9	99.9	99.9	99.9	99.9

The key findings from Table 5.5 are listed below:

- ♦ At least 99 percent of beneficiaries had access to PCPs within the MCMC time/distance standards for all MCPs.
- Only 96.4 and 97.6 percent of CalViva and Partnership beneficiaries, respectively, had access to inpatient hospitals within the time/distance standards. CHW and KFHC had fewer than 99.0 percent of beneficiaries with access to both inpatient and outpatient hospitals.
- The percentage of members with access to PCPs and hospitals within the KKA time/distance standards were similar to the results for the MCMC time/standards and are presented in Appendix C.

Table 5.6 displays the percentage of MCMC adult and pediatric beneficiaries with access to PCPs, by MCP and provider panel status.

Table 5.6—Percentage of Beneficiaries with Access within MCMC Time/Distance Standards to All PCPs and PCPs Identified as Accepting New Patients, by MCP

KFHC	99.9	95.9	99.9	95.3	99.9	95.3	99.9	96.2
L.A. Care	99.9	99.9	99.9	99.9	99.9	99.9	99.9	99.9
Molina	99.9	99.9	99.9	99.9	99.9	99.9	99.9	99.9
Partnership	99.8	99.8	99.8	99.8	99.8	99.8	99.8	99.8
SCFHP	99.9	99.9	99.9	99.9	99.9	99.9	99.9	99.9
SFHP	99.9	99.9	99.9	99.9	99.9	99.9	99.9	99.9

The key findings from Table 5.6 are listed below:

- ♦ At least 99 percent of beneficiaries had access to PCPs within the MCMC time/distance standards for all MCPs, when evaluating all PCPs.
- However, when limiting the analysis to providers accepting new patients, the percentage of beneficiaries with access all PCP provider categories (i.e., Adult Primary Care; Pediatric Primary Care; Pediatric Primary Care, Excluding OB/GYN; and PCP [All]) fell just below the standard for Anthem and KFHC, as indicated by the grey shading.

#### **Time/Distance Analysis**

HSAG used beneficiary and provider data provided by DHCS to assess the distance (in miles) and time (in minutes) to the first, second, and third nearest providers for the provider categories reviewed in this analysis. A smaller average distance or shorter travel time<sup>27</sup> indicates greater accessibility to providers because individuals must travel fewer miles or minutes to access care. In general, the smaller the average distance between beneficiaries and providers across specialties, the greater the alignment in the geographic distribution of providers and beneficiaries. Results in this section show the statewide weighted averages of the distance and time the beneficiaries traveled, weighted by MCP enrollment. Results for each MCP are presented in Appendix C.

Table 5.7 displays the statewide weighted average distance and time to the nearest PCP and core specialty providers.

\_

<sup>&</sup>lt;sup>27</sup> Quest Analytics determined drive time based on the following parameters: 30 miles per hour (mph) for urban, 45 mph for suburban, and 55 mph for rural. Estimates did not account for time of day, traffic, or traffic control devices (e.g., stop signs, stop lights) and may not mirror driver experience due to varying traffic conditions.

# Table 5.7—Statewide Weighted Average Distance and Time to Nearest PCP and Core Specialty Providers

\*The weighted average for the distance/time to the second or third provider may be less than the first or second provider, respectively, due to some MCPs only having one or two providers in a provider category; therefore, the MCPs included in the statewide average calculation were not consistent in the calculations for first, second, and third nearest providers.

SNF	5.6	8.4	10.0	7.9	12.1	14.4		

The key findings from Table 5.7 are listed below:

- The weighted average travel distance and time to the first, second, and third nearest providers for PCPs were less than two miles and three minutes statewide, respectively. As shown in Appendix C, the average distance to the nearest adult PCP ranged from less than one mile for SFHP to approximately four miles for Kaiser NorCal. Average distances and times to pediatric PCPs followed similar patterns.
- ♦ Given the large number of MCPs, MCP-specific results are presented in Appendix C. However, the MCP-specific findings are discussed here given the importance of assessing differences in access among the MCPs. In general, beneficiaries had access to adult core specialty providers within shorter distances and times compared to pediatric core specialists. This was consistent across all MCPs. Some provider categories (e.g., Pediatric Dermatology, Pediatric Infectious Disease, Pediatric Mental Health Outpatient Services, Pediatric Orthopedic Surgery, Pediatric Otolaryngology/ENT, and Pediatric Physical Medicine and Rehabilitation) had several MCPs that reported no providers; therefore, time/distance calculations for those MCPs could not be determined. For example, six MCPs did not report having pediatric dermatologists (Anthem, CalOptima, CCAH, Kaiser SoCal, KFHC, and Molina); an additional two MCPs (CenCal and Gold Coast) only reported having one pediatric dermatologist; and another five MCPs (CalViva, CCHP, Health Net, Kaiser NorCal, and L.A. Care) only reported two pediatric dermatologists. The average distance and time to the three nearest pediatric dermatologists could only be calculated for 10 of 23 MCPs included in the analysis.

Table 5.8, Table 5.9, Table 5.10, and Table 5.11 display the statewide weighted average distance and time to the nearest providers for beneficiaries in large, medium, small, and rural areas, respectively.

## Table 5.8—Statewide Weighted Average Distance and Time to Nearest PCP and Core Specialty Providers for Beneficiaries in Areas with a Large Urbanicity

\*The weighted average for the distance/time to the second or third provider may be less than that of the first or second provider, respectively, due to some MCPs having only one or two providers in a provider category; therefore, the MCPs included in the statewide average calculation were not consistent in the calculations for the first, second, and third nearest providers.

# Table 5.9—Statewide Weighted Average Distance and Time to Nearest PCP and Core Specialty Providers for Beneficiaries in Areas with a Medium Urbanicity

\*The weighted average for the distance/time to the second or third provider may be less than that of the first or second provider, respectively, due to some MCPs having only one or two providers in a provider category; therefore, the MCPs included in the statewide average calculation were not consistent in the calculations for the first, second, and third nearest providers.

Provider Category	(in Mi	Average les) to the F			Average Time (in Minute to the Nearest Provide

SNF	13.2	35.3	42.1	14.5	40.6	48.9

The key findings from Table 5.8, Table 5.9, Table 5.10, and Table 5.11 are listed below:

- ◆ The weighted average travel distance and time to the first, second, and third nearest PCP providers (i.e., adult primary care, pediatric primary care, and PCPs) were less than two miles and approximately two minutes for beneficiaries in areas with a large urbanicity (i.e., high population density) but nearly five miles and approximately five minutes for beneficiaries in rural areas, respectively. While the statewide weighted average indicated that, on average, beneficiaries had access to PCPs within reasonable distances and times, beneficiaries in rural areas had to travel, on average, at least twice as far and twice as long to the nearest PCP providers (i.e., adult primary care, pediatric primary care, and PCPs).
- Beneficiaries in areas with a large or medium urbanicity also had access to non-physician medical practitioners with both shorter travel distances and times than beneficiaries in rural and small urbanicity areas. For example, to access a certified nurse midwife, beneficiaries in rural areas would have to travel 43.7 miles and 49.1 minutes compared to beneficiaries in large urban areas who would only have to travel 9.6 miles and 16.1 minutes.
- Beneficiaries in large urban areas had access to adult and pediatric core providers with much shorter travel distances and times than beneficiaries in rural areas. Access to pediatric core specialists was very limited for beneficiaries in rural areas. On average, beneficiaries living in rural areas would have to travel over 100 miles to the nearest pediatric dermatologist, endocrinologist, gastroenterologist, general surgeon, hematology and oncology provider, infectious disease specialist, mental health specialist, nephrologist,

- neurologist, otolaryngology/ENT provider, physical medicine and rehabilitation provider, or pulmonary disease specialist.
- As expected, beneficiaries living in small and rural areas had the nearest access to RHCs.
- Beneficiaries in large urban areas had access to the nearest inpatient and outpatient hospitals, on average, within 3.1 miles/5.5 minutes and 1.1 miles/2.0 minutes, respectively. Comparatively, beneficiaries in rural areas had access to the nearest inpatient and outpatient hospitals, on average, within 9.1 miles/10.1 minutes and 4.1 miles/4.5 minutes, respectively.
- No beneficiaries in rural areas had access to ICFs; the MCPs with reporting units in rural areas did not report being contracted with any ICFs.

#### **Availability of Services**

#### Access-Related Complaints, Grievances, and Appeals

This section shows results from the Access-Related Complaints, Grievances, and Appeals analysis based on CY 2017 ombudsman calls and 2016–2017 grievances, appeals, and complaints data. The results include MCP-specific grievances rates and a statewide ombudsman complaints rate.

Figure 5.39 displays 12-month grievance rates, by MCP and rolling quarter. Results are displayed as the rate per 1,000 member months (MM).

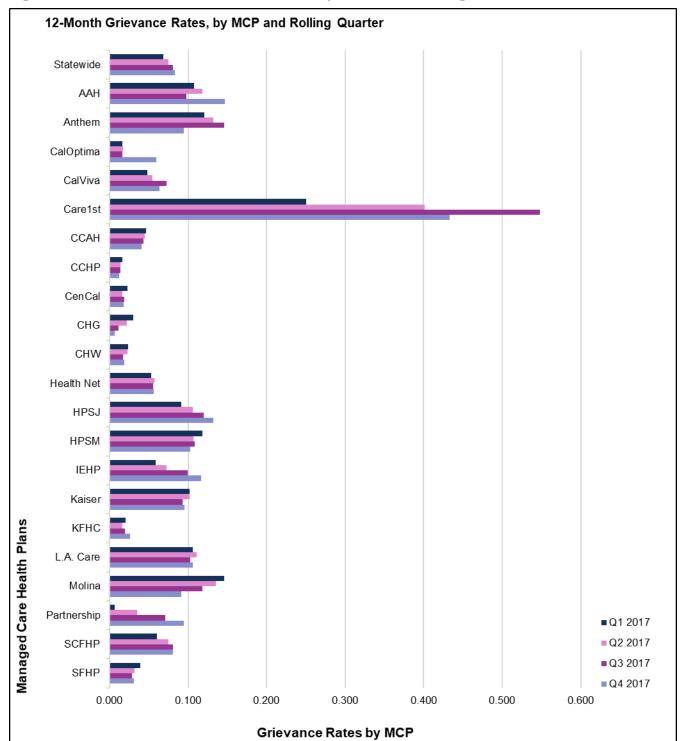

Figure 5.39—12-Month Grievance Rates, by MCP and Rolling Quarter\*

<sup>\*</sup>Rates were calculated per 1,000 MM.

<sup>\*</sup>Rates were combined for Southern and Northern Kaiser Health Plans.

\*Each rolling "quarter" consists of four reporting quarters (e.g., Q1 2017 = Q2 2016, Q3 2016, Q4 2016, and Q1 2017).

\*To satisfy the Health Insurance Portability and Accountability Act of 1996 (HIPAA) Privacy Rule's de-identification standard, Gold Coast rates were suppressed because the numerator for this indicator was less than 11.

The key findings from Figure 5.39 are listed below:

- ◆ The overall statewide rate increased every quarter, with a total increase of 20 percent from Q1 2017 to Q4 2017; however, not all MCPs followed the statewide trend.
- The following plans' rates increased every quarter: HPSJ, IEHP, SCFHP, and Partnership.
- Partnership's Q4 2017 rate was 14 times greater than its Q1 2017 rate.
- Care1st had the highest grievance rates for all four quarters compared to other MCPs. Care1st's rates ranged from about two to five times greater than the MCP with the next-highest rate during the same period.
- ◆ The following plans' rates decreased every quarter: CCAH, CCHP, CHG, and Molina.

Appendix D contains detailed MCP-specific 12-month grievance rates, by rolling quarter.

Table 5.12 displays the CY 2017 rate of access-related ombudsman complaints. Results are displayed as the rate per 1,000 MM. Note the following regarding Table 5.12:

- Member months were calculated for CY 2017 for all members.
- Rates were calculated per 1,000 MM.
- ◆ To satisfy the HIPAA Privacy Rule's de-identification standard, MCP rates were suppressed because most numerators for this indicator were less than 11.

Table 5.12—Rate of Ombudsman Access-Related Complaints per 1,000 MM

	Member Months	Number of Access- Related Complaints	Rate of Access- Related Complaints
Statewide	128,941,969	222	0.002

The key findings from Table 5.12 are listed below:

 The overall statewide rate for ombudsman complaints related to access was relatively low at 0.002 per 1,000 MM.

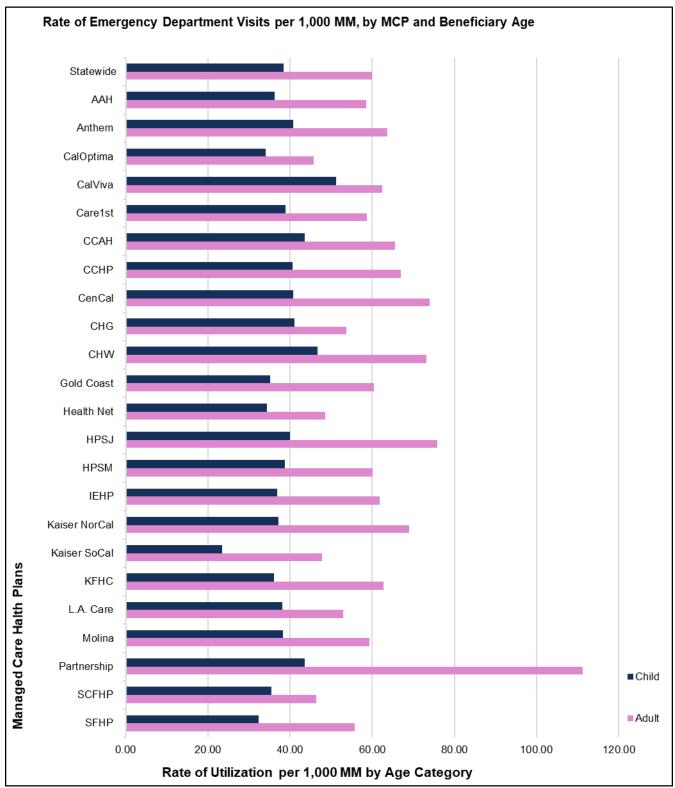

#### Service Utilization

Service utilization was examined using two sets of measures. The first set was based on utilization of specific services based on aggregated encounter data provided to HSAG by DHCS. Specific services examined include the following:

- Emergency department visits
- Urgent care visits
- Inpatient admissions
- Outpatient visits
- Mental health outpatient visits
- ◆ Telemedicine
- ♦ NENMT

<u>Emergency Department Utilization:</u> Figure 5.40 displays the CY 2017 emergency department usage rate, by MCP and beneficiary age. Results are displayed as the rate per 1,000 MM.

Figure 5.40—Rate of Emergency Department Visits per 1,000 MM, by MCP and Beneficiary Age

The key findings from Figure 5.40 are listed below:

- Emergency department visits were consistently lower for children than adults across all MCPs.
- Partnership had very high emergency department utilization for adults at 111 visits per 1,000 MM—nearly twice the statewide average.
- CalViva had high emergency department utilization for children at 51 visits per 1,000 MM.
- ♦ Kaiser SoCal had low emergency department utilization for both children and adults at 23 and 48 visits per 1,000 MM, respectively.

Appendix D contains detailed rates of emergency department utilization, by MCP and beneficiary age.

Figure 5.41 displays the CY 2017 rate of emergency department usage, by urbanicity. Results are displayed as the rate per 1,000 MM.

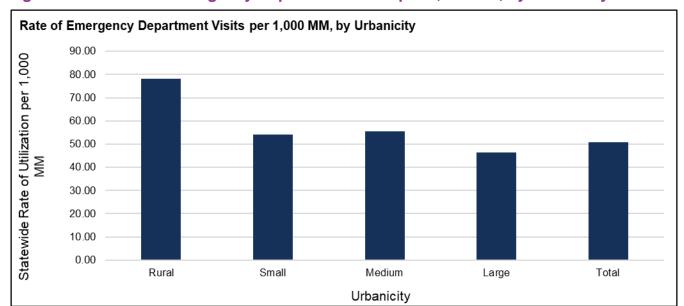

Figure 5.41—Rate of Emergency Department Visits per 1,000 MM, by Urbanicity

The key findings from Figure 5.41 are listed below:

- Statewide, rural areas had higher emergency department utilization than large or highdensity areas.
- For some MCPs serving multiple urbanicities, rural or small areas had lower rates than large or high-density areas, such as Kaiser NorCal and Molina.

Appendix D contains detailed rates of emergency department utilization, by MCP and urbanicity.

<u>Urgent Care Utilization:</u> Figure 5.42 displays the CY 2017 rate of urgent care usage, by MCP and beneficiary age. Results are displayed as the rate per 1,000 MM.

Rate of Urgent Care Visits per 1,000 MM, by MCP and Beneficiary Age Statewide AAH Anthem CalOptima CalViva Care1st CCAH CCHP CenCal CHG CHW Gold Coast Health Net **HPSJ HPSM IEHP** Kaiser NorCal Kaiser SoCal Managed Care Health Plans **KFHC** L.A. Care Molina Partnership ■ Child **SCFHP** SFHP Adult 0.00 5.00 10.00 15.00 20.00 25.00 30.00 35.00 40.00 45.00 Rate of Utilization per 1,000 MM by Age Category

Figure 5.42—Rate of Urgent Care Visits per 1,000 MM, by MCP and Beneficiary Age

The key findings from Figure 5.42 are listed below:

- Three MCPs (HPSJ, KFHC, and IEHP) had high urgent care rates for both adults and children.
- Two MCPs (Care1st and Gold Coast) had high urgent care rates for children but relatively low rates for adults.
- Five MCPs (CCAH, HPSM, Kaiser NorCal, SFHP, and Kaiser SoCal) had very few urgent care visits for both children and adults at less than one visit per 1,000 MM.

Appendix D contains detailed rates of urgent care utilization, by MCP and beneficiary age.

Figure 5.43 displays the CY 2017 rate of urgent care usage, by urbanicity. Results are displayed as the rate per 1,000 MM.

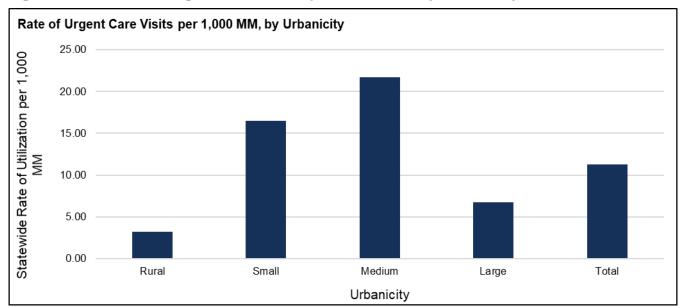

Figure 5.43—Rate of Urgent Care Visits per 1,000 MM, by Urbanicity

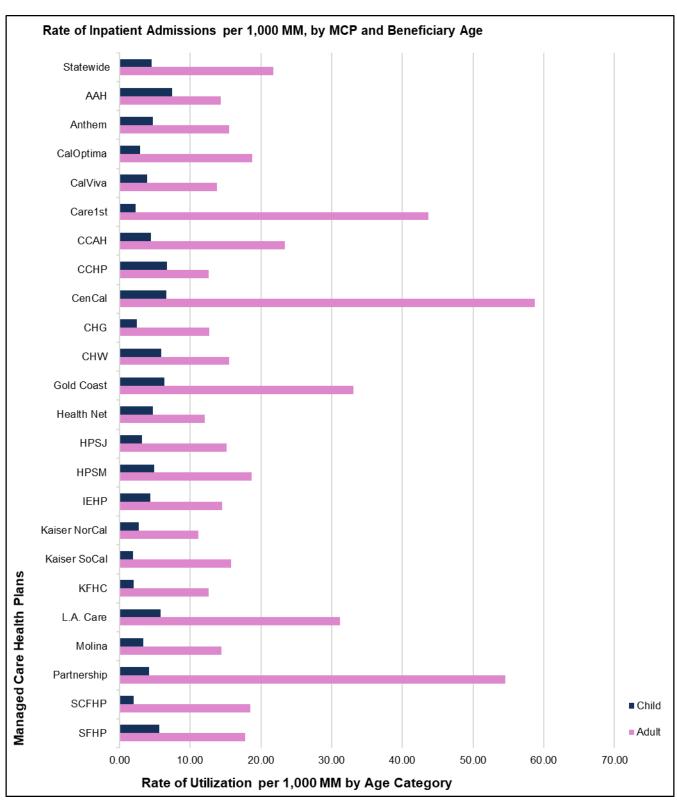

The key finding from Figure 5.43 is listed below:

 Small and medium urbanicities show higher utilization of urgent care visits, which is likely because the three MCPs (HPSJ, IEHP, and KFHC) that are in these urbanicities have very high urgent care utilization at over 30 per 1,000 MM.

Appendix D contains detailed rates of urgent care utilization, by MCP and urbanicity.

<u>Inpatient Admissions:</u> Figure 5.44 displays the CY 2017 rate of inpatient admissions, by MCP and beneficiary age. Results are displayed as the rate per 1,000 MM.

Figure 5.44—Rate of Inpatient Admissions per 1,000 MM, by MCP and Beneficiary Age

The key findings from Figure 5.44 are listed below:

- ◆ Three MCPs (CenCal, Partnership, and Care1st) had high adult inpatient utilization at 59, 55, and 44 admissions per 1,000 MM, respectively.
- Children had lower inpatient admission rates than adults across all MCPs.
- There was more variation across the MCPs for adult inpatient utilization than for child inpatient utilization.

Appendix D contains detailed inpatient admission rates, by MCP and beneficiary age.

Figure 5.45 displays the CY 2017 rate of inpatient admissions, by urbanicity. Results are displayed as the rate per 1,000 MM.

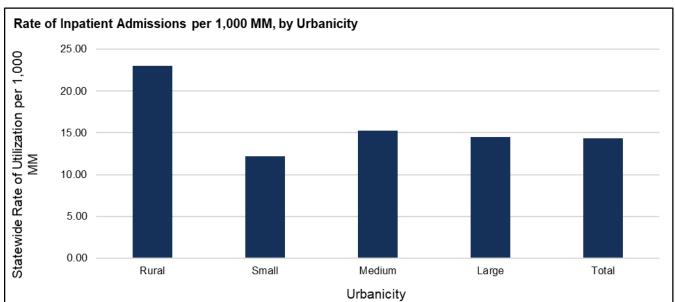

Figure 5.45—Rate of Inpatient Admissions per 1,000 MM, by Urbanicity

The key finding from Figure 5.45 is listed below:

 Statewide, rural areas had higher inpatient utilization than non-rural areas, which was driven by high rates for Partnership at 35 admissions per 1,000 MM.

Appendix D contains detailed rates of inpatient admissions, by MCP and urbanicity.

<u>Outpatient Visits:</u> Figure 5.46 displays the CY 2017 rate of outpatient visits, by MCP and beneficiary age. Results are displayed as the rate per 1,000 MM.

Rate of Outpatient Visits per 1,000 MM, by MCP and Beneficiary Age Statewide AAH Anthem CalOptima CalViva Care1st CCAH CCHP CenCal CHG CHW Gold Coast Health Net **HPSJ HPSM IEHP** Kaiser NorCal Kaiser SoCal Managed Care Health Plans KFHC L.A. Figure 5.46—Rate of Outpatient Visits per 1,000 MM, by MCP and Beneficiary Age

The key findings from Figure 5.46 are listed below:

- Two MCPs (CenCal and SFHP) had high outpatient utilization for adults at 1,708 and 1,674 visits per 1,000 MM, respectively.
- No MCP had fewer than 1,000 outpatient visits per 1,000 MM for adults.
- One MCP (IEHP) had the lowest outpatient utilization for both adults and children at 1,007 and 570 visits per 1,000 MM, respectively.
- Children had consistently lower outpatient visit rates across all MCPs.

Appendix D contains detailed outpatient visit rates, by MCP and beneficiary age.

Figure 5.47 displays the CY 2017 rate of outpatient visits, by urbanicity. Results are displayed as the rate per 1,000 MM.

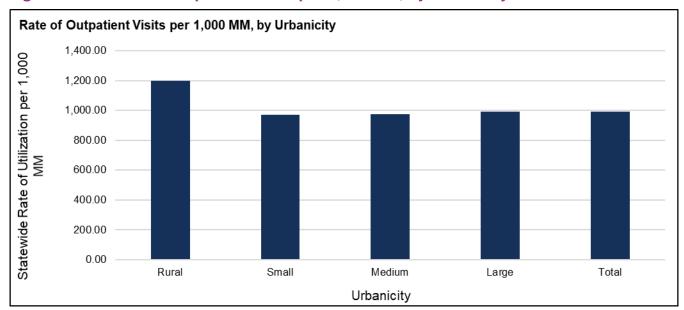

Figure 5.47—Rate of Outpatient Visits per 1,000 MM, by Urbanicity

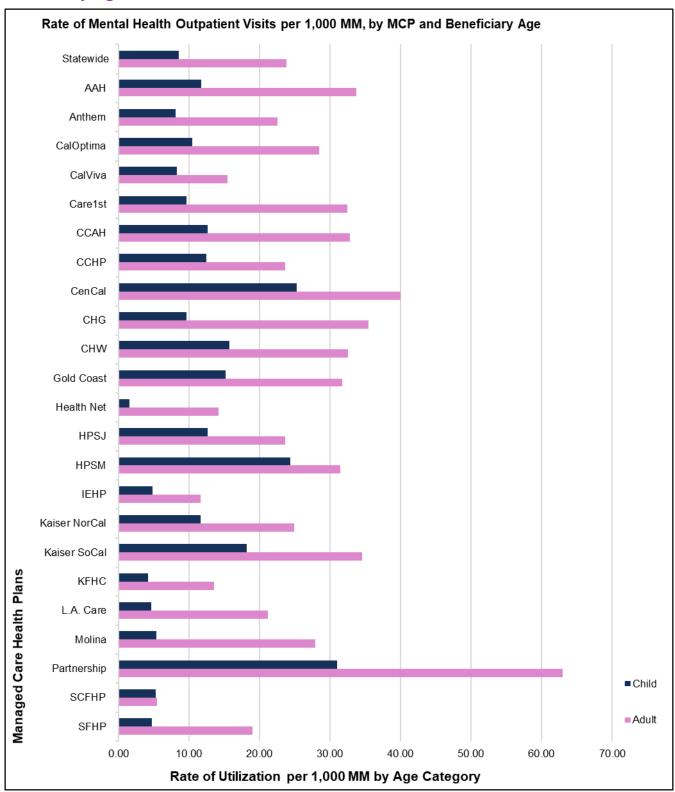

The key findings from Figure 5.47 are listed below:

 Statewide, rural areas had higher outpatient utilization than non-rural areas at 1,199 visits per 1,000 MM.

Appendix D contains detailed outpatient visit rates, by MCP and urbanicity.

<u>Mental Health Outpatient Visits:</u> Figure 5.48 displays the CY 2017 rate of mental health outpatient visits, by MCP and beneficiary age. Results are displayed as the rate per 1,000 MM.

Figure 5.48—Rate of Mental Health Outpatient Visits per 1,000 MM, by MCP and **Beneficiary Age** 

The key findings from Figure 5.48 are listed below:

- Children had consistently lower mental health outpatient utilization rates than adults across all MCPs.
- One MCP (Partnership) had the highest mental health outpatient utilization rates for both adults and children at 63 and 31 visits per 1,000 MM, respectively.
- Three MCPs (Partnership, CenCal, and HPSM) had high rates for children, ranging between 24 and 31 visits per 1,000 member months.
- One MCP (SCFHP) had low utilization rates for both children and adults at five visits per 1,000 MM.
- Health Net had the lowest utilization rates for children, with fewer than two visits per 1,000 MM.

Appendix D contains detailed rates of mental health outpatient visits, by MCP and beneficiary age.

Figure 5.49 displays the CY 2017 rate of mental health outpatient visits, by urbanicity. Results are displayed as the rate per 1,000 MM.

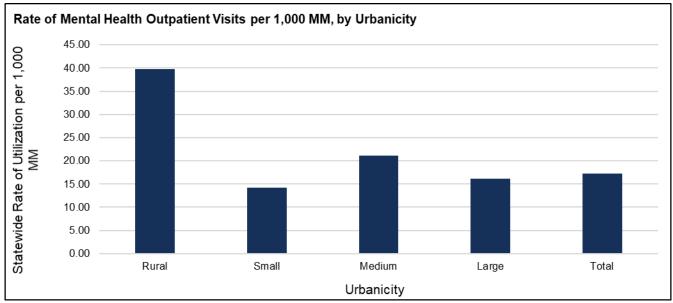

Figure 5.49—Rate of Mental Health Outpatient Visits per 1,000 MM, by Urbanicity

The key findings from Figure 5.49 are listed below:

 Statewide, rural areas had the highest mental health outpatient rates at 40 visits per 1,000 MM, which was driven by very high utilization rates for Partnership, with 61 visits per 1,000 MM.

Appendix D contains detailed rates of mental health outpatient visits, by MCP and urbanicity.

<u>Telehealth/Telemedicine Visits:</u> Table 5.13 displays the CY 2017 rate of telehealth/telemedicine visits, by MCP and beneficiary age. Results are displayed as the rate per 1,000 MM. Note that to satisfy the HIPAA Privacy Rule's de-identification standard, MCP rates with numerators less than 11 have been suppressed (indicated by "S").

Table 5.13—Rate of Telehealth Visits per 1,000 MM, by MCP and Beneficiary Age

SFHP	109	0.10	S	S	S	S
Statewide	27,179	0.37	1,850	0.03	29,029	0.23

The key findings from Table 5.13 are listed below:

- Rates for child telehealth visits were very low across all plans, with the highest rate at 0.16 visits per 1,000 MM (Partnership and CHW).
- Rates for adults varied substantially across plans, from zero (CalOptima) to 1.78 (Partnership) visits per 1,000 MM.

Appendix D contains detailed rates of telehealth/telemedicine visits, by MCP and beneficiary age.

Figure 5.50 displays the CY 2017 rate of telehealth/telemedicine visits, by urbanicity. Results are displayed as the rate per 1,000 MM.

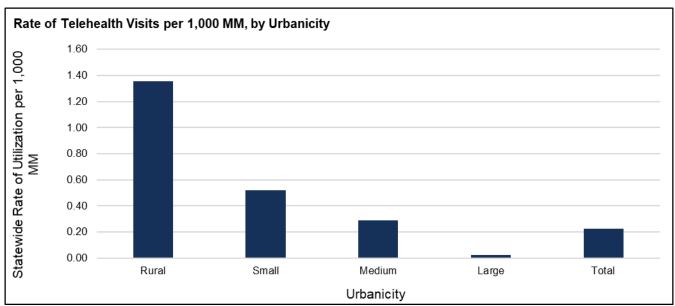

Figure 5.50—Rate of Telehealth Visits per 1,000 MM, by Urbanicity

The key findings from Figure 5.50 are listed below:

 Statewide, telehealth visits were most often used in rural areas, although this was driven by one MCP (Partnership). Rates of telehealth visits decreased as urbanicity increased.

Appendix D contains detailed rates of telehealth/telemedicine visits, by MCP and urbanicity.

<u>NENMT Services:</u> Table 5.14 displays the CY 2017 rate of NENMT services, by MCP and beneficiary age. Results are displayed as the rate per 1,000 MM. Note that to satisfy the HIPAA Privacy Rule's de-identification standard, MCP rates with numerators less than 11 have been suppressed (indicated by "S").

Table 5.14—NENMT Services, by MCP and Beneficiary Age\*

Statewide	1,860,969	25.31	15,814	0.29	1,876,783	14.56

The key findings from Table 5.14 are listed below:

- NENMT services were utilized almost exclusively by adults, with the highest rate for children at 1.21 per 1,000 MM (Molina).
- Molina also had very high NENMT rates for adults at 66 per 1,000 MM.
- One MCP (Care1st) had very low rates of less than one per 1,000 MM.

Appendix D contains detailed rates of NENMT services, by MCP and beneficiary age.

Figure 5.51 displays the CY 2017 rate of NENMT services, by urbanicity. Results are displayed as the rate per 1,000 MM.

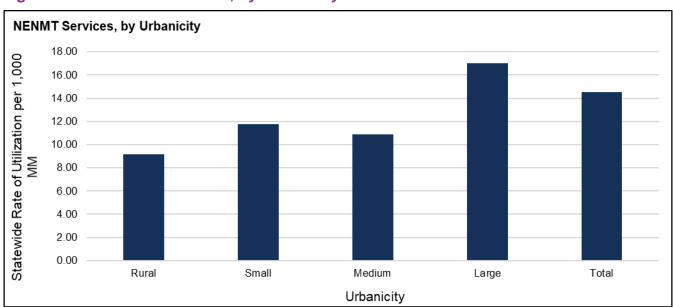

Figure 5.51—NENMT Services, by Urbanicity

The key findings from Figure 5.51 are listed below:

♦ Statewide, NENMT services were typically used in large or high-density areas.

Appendix D contains detailed rates of NENMT services, by MCP and urbanicity.

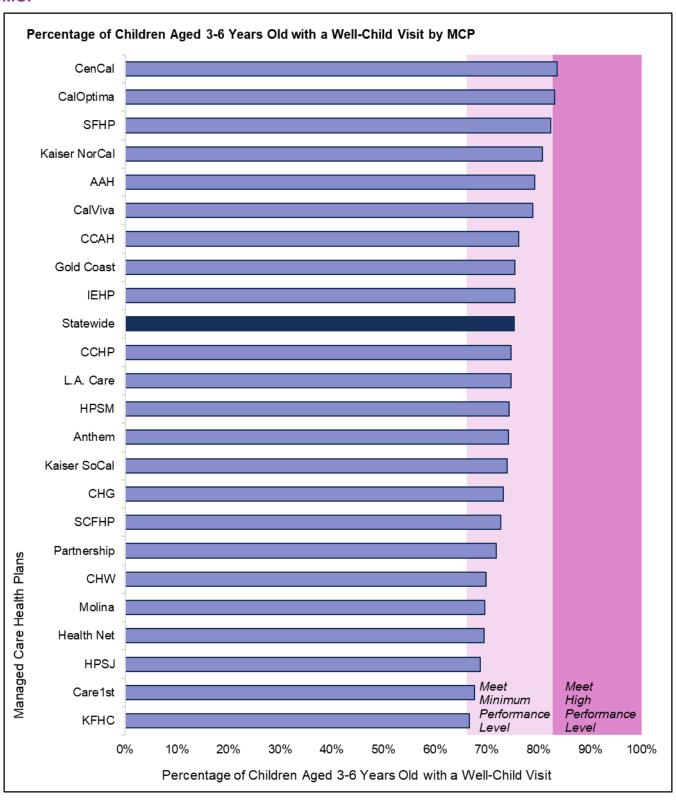

The second set of utilization measures that were assessed included four HEDIS measures:

- Well-Child Visits in the Third, Fourth, Fifth and Sixth Years of Life (W34)
- Ambulatory Care (AMB)
- Prenatal and Postpartum Care (PPC)
- Children and Adolescents' Access to Primary Care Practitioners (CAP)

Note that despite similarities in some measure names, the definitions of the specific service measures assessed above and the HEDIS measures are different, and as a result the values between the two measure groups are not expected to match.

<u>Well-Child Visits in the Third, Fourth, Fifth and Sixth Years of Life (W34):</u> Figure 5.52 displays the percentage of children ages 3 to 6 years that received a well-child visit, as well as the DHCS minimum performance level and high performance level for the measure.

Figure 5.52—Percentage of Children Ages 3–6 Years with A Well-Child Visit (W34), by MCP

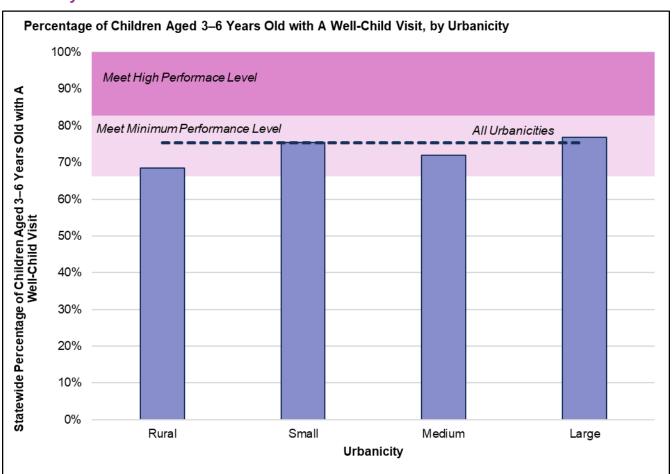

The key findings from Figure 5.52 are listed below:

- All MCPs met the minimum performance level for the percentage of children ages 3 to 6 years with a PCP visit during the year.
- ◆ Two MCPs (CenCal and CalOptima) met the high performance level.

Figure 5.53 displays the *W34* rates, by beneficiary urbanicity.

Figure 5.53—Percentage of Children Ages 3–6 Years with A Well-Child Visit (W34), by Urbanicity

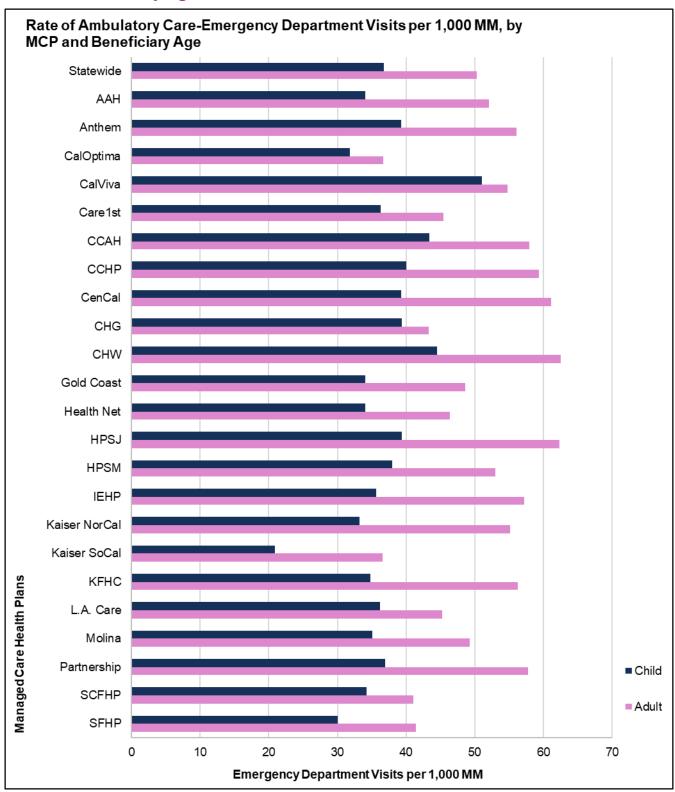

The key finding from Figure 5.53 is listed below:

 Children ages 3 to 6 years in rural areas had lower rates of PCP visits when compared to children in large or high-density areas.

Appendix D contains detailed *W34* rates, by MCP and urbanicity.

<u>Ambulatory Care—Emergency Department Visits:</u> Figure 5.54 displays emergency department visit rates per 1,000 MM, by MCP and beneficiary age.

Figure 5.54—Rate of Ambulatory Care—Emergency Department Visits per 1,000 MM, by **MCP** and Beneficiary Age

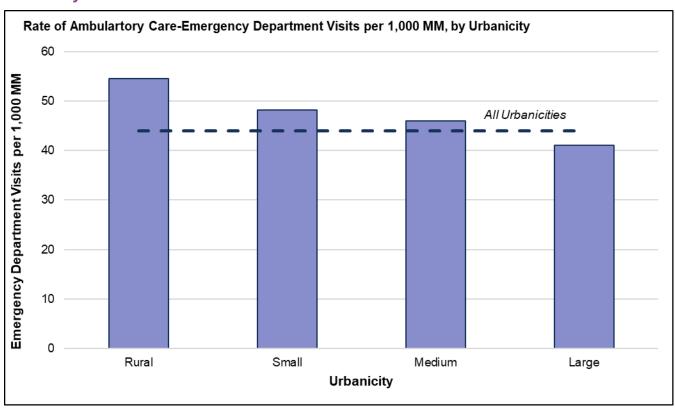

The key findings from Figure 5.54 are listed below:

- Ambulatory emergency department visits were consistently lower for children than adults across all MCPs.
- Five MCPs (CalOptima, Kaiser NorCal, Kaiser SoCal, SCFHP, and SFHP) had low emergency department utilization for children.
- Kaiser SoCal had low emergency department utilization in combination with relatively high outpatient utilization, suggesting beneficiaries may be obtaining outpatient treatment in lieu of the emergency department.
- Conversely, Anthem, Partnership, HPSJ, and CHW had low overall outpatient utilization but relatively high emergency department utilization.
- Three MCPs (CalOptima, CalViva, and CHG) had only a small difference between child and adult emergency department utilization rates.

Appendix D contains detailed ambulatory care rates for emergency department visits, by MCP and beneficiary age.

Figure 5.55 displays the ambulatory care rates for emergency department visits, by beneficiary urbanicity.

Figure 5.55—Rate of Ambulatory Care—Emergency Department Visits per 1,000 MM, by Urbanicity

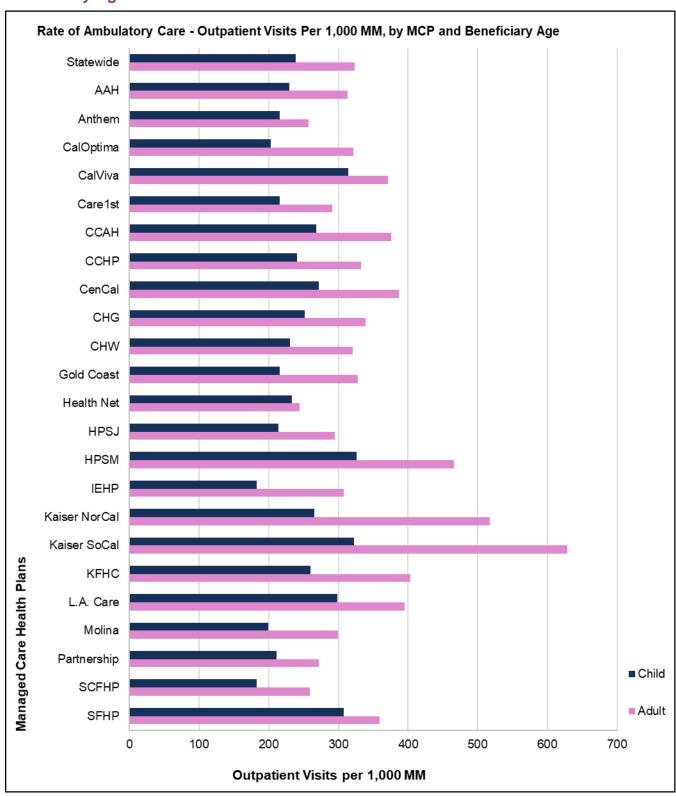

The key findings from Figure 5.55 are listed below:

- Statewide, the rate of ambulatory emergency department visits decreased as urbanicity increased. This general trend was also evident in the emergency department utilization measure described above.
- The low statewide ambulatory emergency department visit rate for large urbanicity areas was driven by low rates for MCPs that exclusively serve these areas, such as Kaiser SoCal, CalOptima, SFHP, and SCFHP.

Appendix D contains detailed ambulatory care rates for emergency department visits, by MCP and urbanicity.

<u>Ambulatory Care—Outpatient Visits:</u> Figure 5.56 displays rates of outpatient visits per 1,000 MM, by MCP and beneficiary age.

Figure 5.56—Rate of Ambulatory Care—Outpatient Visits per 1,000 MM, by MCP and Beneficiary Age

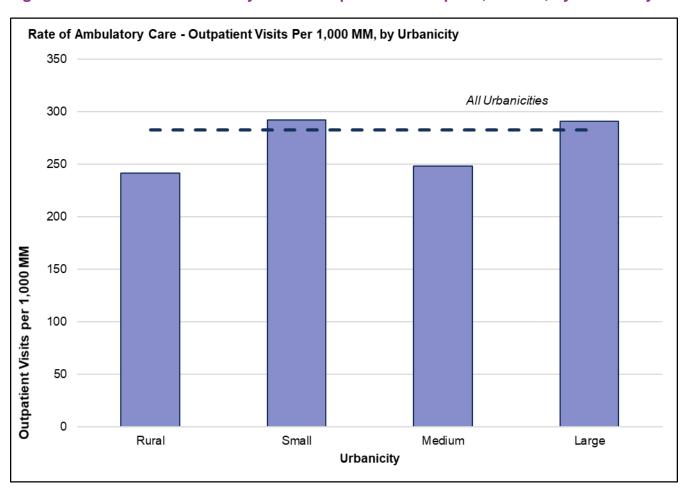

The key findings from Figure 5.56 are listed below:

- Ambulatory outpatient visits were consistently lower for children than adults across all MCPs.
- One MCP (Kaiser SoCal) had very high outpatient utilization. Two additional MCPs (HPSM and Kaiser NorCal) had particularly high outpatient utilization compared to other MCPs.
- Two MCPs (IEHP and SCFHP) had particularly low outpatient utilization for children.
- Two MCPs (Health Net and Anthem) had similar rates between children and adults.

Appendix D contains detailed ambulatory care rates for outpatient visits, by MCP and beneficiary age.

Figure 5.57 displays the ambulatory care rates for outpatient visits, by MCP and beneficiary urbanicity.

Figure 5.57—Rate of Ambulatory Care—Outpatient Visits per 1,000 MM, by Urbanicity

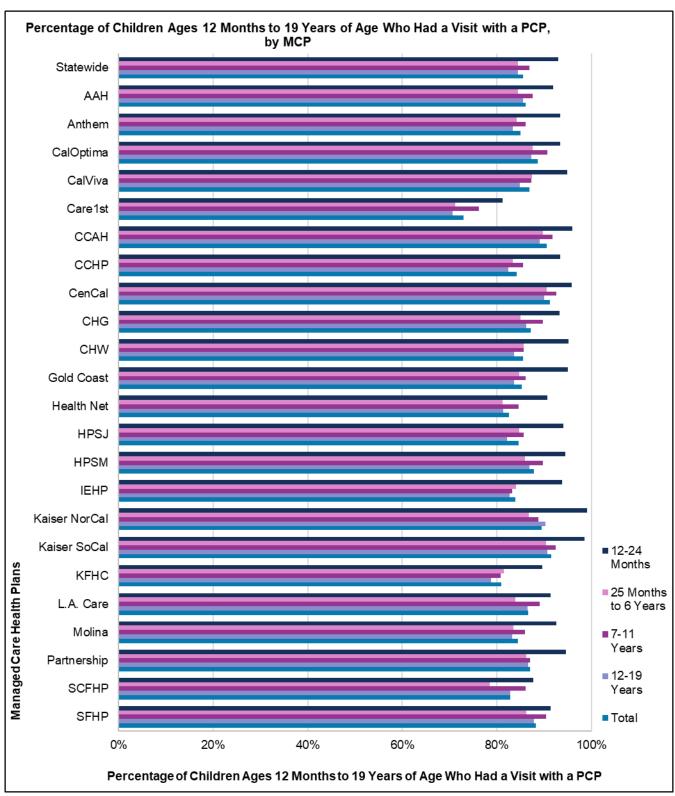

The key finding from Figure 5.57 is listed below:

• Statewide, outpatient rates were similar for rural and medium density areas, and small and large areas had similar rates.

Appendix D contains detailed ambulatory care rates for outpatient visits, by MCP and urbanicity.

<u>Children and Adolescents' Access to Primary Care Practitioners (CAP):</u> Figure 5.58 displays the percentage of children ages 12 months to 19 years who had a visit with a PCP.

Figure 5.58—Percentage of Children Ages 12 Months to 19 Years Who Had a Visit with a PCP

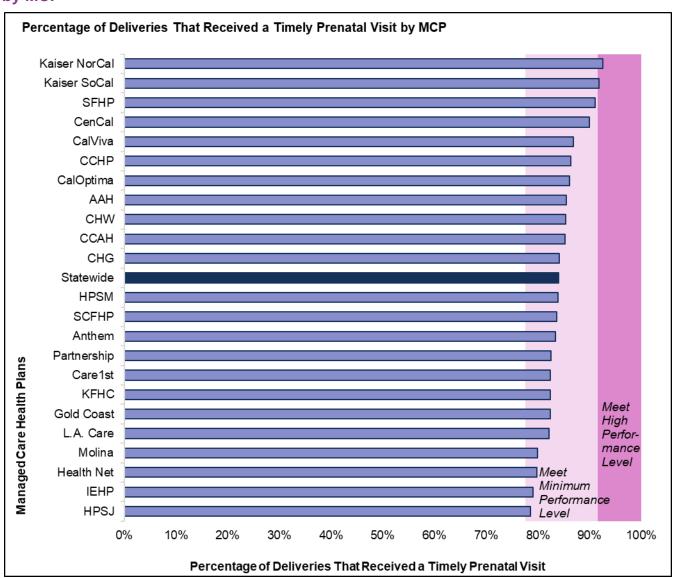

The key findings from Figure 5.58 are listed below:

- Children in the youngest age bracket (i.e. between 12 and 24 months) had the highest rates among all MCPs.
- One MCP (Care1st) had noticeably lower rates than did other MCPs.

<u>Prenatal and Postpartum Care—Timeliness of Prenatal Care (PPC-Pre):</u> Figure 5.59 displays the percentage of deliveries that received a timely prenatal visit, by MCP, as well as the DHCS minimum performance level and high performance level for the measure.

Figure 5.59—Percentage of Deliveries That Received a Timely Prenatal Visit (PPC-Pre), by MCP

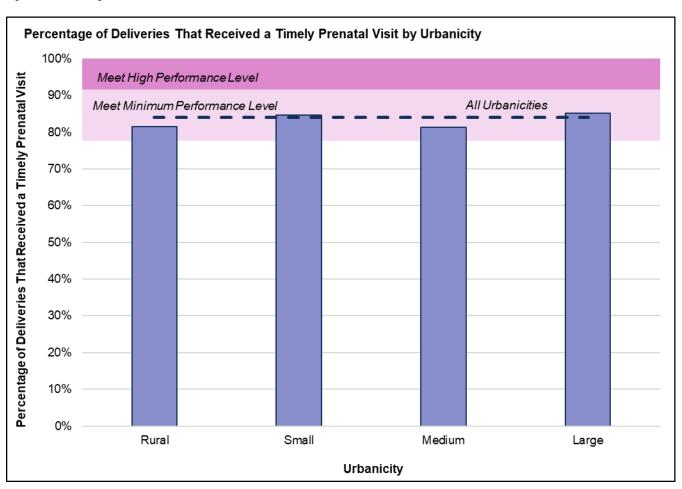

The key findings from Figure 5.59 are listed below:

- Two MCPs' rates (Kaiser NorCal and Kaiser SoCal) were above the high performance level.
- ♦ All MCPs rates met the minimum performance level, with rates of at least 77.7 percent.

Appendix D contains detailed *PPC-Pre* rates, by MCP and beneficiary age.

Figure 5.60 displays the percentage of deliveries that received a timely prenatal visit, by beneficiary urbanicity.

Figure 5.60—Percentage of Deliveries That Received a Timely Prenatal Visit (PPC-Pre), by Urbanicity

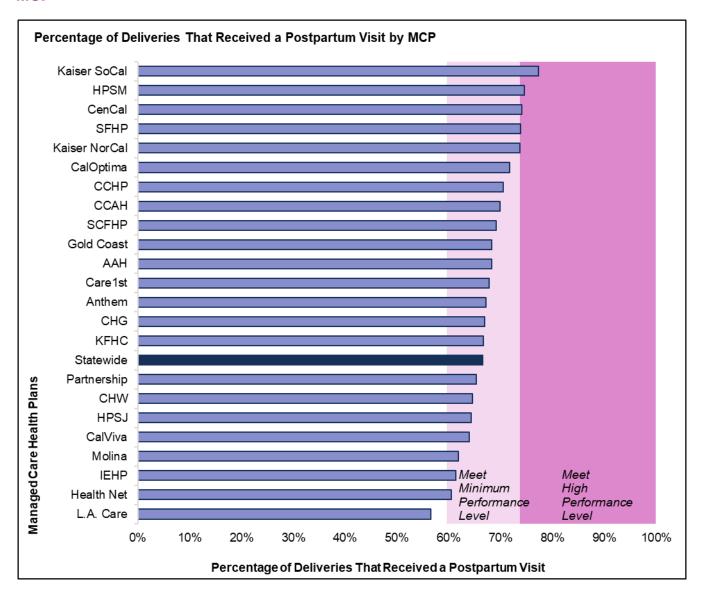

The key findings from Figure 5.60 are listed below:

 All urbanicities met the minimum performance level, although rates for prenatal screening were not correlated with urbanicity at the statewide level.

Appendix D contains detailed *PPC-Pre* rates, by MCP and urbanicity.

<u>Prenatal and Postpartum Care—Postpartum Care (PPC-Post):</u> Figure 5.61 displays the percentage of deliveries that had a postpartum visit, by MCP, as well as the DHCS minimum performance level and high performance level for the measure.

Figure 5.61—Percentage of Deliveries That Received a Postpartum Visit (PPC-Post), by MCP

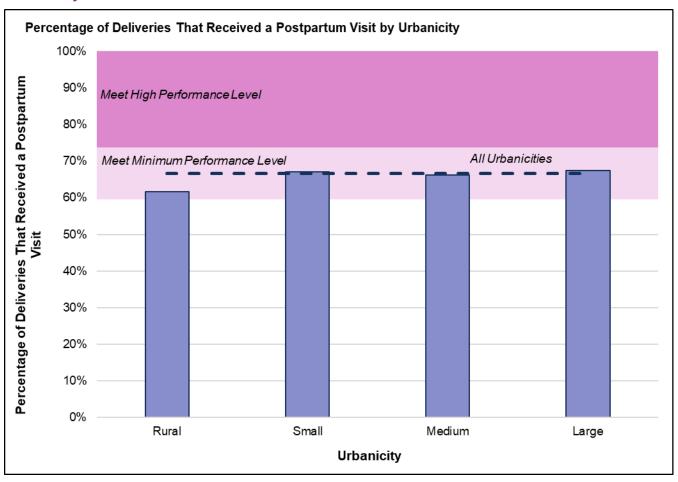

The key findings from Figure 5.61 are listed below:

- Five MCPs' rates (Kaiser SoCal, HPSM, CenCal, SFHP, and Kaiser NorCal) met the high performance level of 73.7 percent.
- One MCP's rate (L.A. Care) fell below the minimum performance level of 59.6 percent.

Appendix D contains detailed *PPC-Post* rates, by MCP and beneficiary age.

Figure 5.62 displays the percentage of deliveries that had a postpartum visit, by beneficiary urbanicity.

Figure 5.62—Percentage of Deliveries That Received a Postpartum Visit (PPC-Post), by Urbanicity

The key finding from Figure 5.62 is listed below:

• Statewide, rural areas had lower rates of postpartum care than non-rural areas.

Appendix D contains detailed *PPC-Post* rates, by MCP and urbanicity.

### Appointment Availability

HSAG used call data provided by DHCS to assess the first, second, and third available appointments for regular and urgent PCP visits, new and established specialists, and prenatal specialists. The time to appointment was calculated as business days or calendar days based on the established standard for the type of appointment. Appointment data were available for only a limited number of MCPs. Data availability varied across the specific type of appointment, even among included MCPs.

Table 5.15 displays the average number of business days to an appointment and the percentage of appointment availability calls meeting the standard (10 business days) for non-urgent PCP appointments, by MCP, for 2017.

#### Table 5.15—2017 Appointment Availability—PCP (Regular), by MCP

\*The Percent Meeting Standard was calculated for the third available appointment.

 Indicates	that the	rate was	not available	2
แนเบลเบิง	uiai iiic	Tale was	TIOL available	J.

	PCP (Regular)					
MCP	1st Available	2nd Available	3rd Available	Percent Meeting Standard*		
CalOptima	2.8	3.2	3.8	100%		
Care1st	1.6					
CHG	3.2	4.4	6.8	80%		
CCHP	5.8	6.4	6.4	80%		
Health Net	2.2	7.6	9.2	80%		
IEHP	5	6	7	80%		
KFHC	5	7	8.6	80%		
SFHP	1.2	2.2	3	100%		
SCFHP	7	10.8	11.6	60%		

The key findings from Table 5.15 are listed below:

- Two MCPs met the 10 business days standard 100 percent of the time, five MCPs met the 10 business days standard 80 percent of the time, and one MCP met the 10 business days standard 60 percent of the time.
- The two MCPs that met the standard 100 percent of the time had the lowest mean number of days across the first, second, and third available appointments.

Table 5.16 displays the average number of calendar days to an appointment and the percentage of appointment availability calls meeting the standard (48 hours) for urgent PCP appointments, by MCP, for 2017.

#### Table 5.16—2017 Appointment Availability—PCP (Urgent), by MCP

- \*The Percent Meeting Standard was calculated for the third available appointment.
- Indicates that the rate was not available.

	PCP (Urgent)					
MCP	1st Available	2nd Available	3rd Available	Percent Meeting Standard*

KFHC	17.8	21.4	24	60%		
SFHP	12.4	14.4	18	40%		
SCFHP	6.2	6.8	8	80%		

The key findings from Table 5.17 are listed below:

- Two MCPs met the 15-business-day standard for new patient appointments with specialists 80 percent of the time, three MCPs met the standard 60 percent of the time, and one MCP met the standard 40 percent of the time.
- Three MCPs reported an average number of days to first, second, and third available new patient appointments with specialists within the15-business-day standard.

Table 5.18 displays the average number of business days to an appointment and the percentage of appointment availability calls meeting the standard (15 business days) for established patient appointments with specialists, by MCP, for 2017.

#### Table 5.18—2017 Appointment Availability—Specialist (Established Patient), by MCP

\*The Percent Meeting Standard was calculated for the third available appointment.

— Indicates that the rate was not available.

	Specialist (Established Patient)					
MCP	1st Available	2nd Available	3rd Available	Percent Meeting Standard*

KFHC	7.6	10.4	13	80%		
SFHP	6.4	9.4	11.2	60%		
SCFHP	3	4.8	6.2	100%		

The key findings from Table 5.18 are listed below:

- Four MCPs met the 15-business-day standard for established patient appointments with specialists 100 percent of the time, two MCPs met the standard 80 percent of the time, and one MCP met the standard 60 percent of the time.
- Seven MCPs reported an average number of days to first, second, and third available established patient appointments with specialists within the 15-business-day standard.

Table 5.19 displays the average number of calendar days to an appointment and the percentage of appointment availability calls meeting the standard (two weeks) for appointments with prenatal care providers, by MCP, for 2017.

#### Table 5.19—2017 Appointment Availability—Specialist (Prenatal), by MCP

- \*The Percent Meeting Standard was calculated for the third available appointment.
- \*\*Calculations were based on a 10-business-day requirement for CalOptima and a two-week requirement for all other MCPs.
- Indicates that the rate was not available.

	Prenatal					
MCP	1st Available	2nd Available	3rd Available	Percent Meeting Standard*		
CalOptima**	2.38	2.63	3.5	100%		
Care1st	3.2			_		
CHG	13.8	17.8	19.4	40%		
CCHP	19.4	20.8	22.2	0%		
Health Net	7	10.25	11.75	75%		
IEHP	4	4.2	5.8	100%		
KFHC	14.2	17.8	20.8	40%		
SFHP	15.67	17.17	17.67	83%		
SCFHP	11.8	14.2	17.4	60%		

The key finding from Table 5.19 is listed below:

◆ Two MCPs met the two-week standard for appointments with prenatal providers 100 percent of the time, three MCPs met the standard between 60 and 83 percent of the time, two MCPs met the standard 40 percent of the time, and one MCP met the standard 0 percent of the time.

Since data were only available for nine MCPs from CY 2017, summary results from the CY 2016 post-audit verification appointment availability studies are available in Appendix D.

# **Access to Care Monitoring**

As part of the DHCS Access Assessment, HSAG conducted a comparative desk review of California's existing network requirements, standards, and monitoring program relative to the Medicaid and CHIP revised final rule for Medicaid managed care (42 CFR §438). HSAG conducted a comprehensive desk review of the KKA and MCMC boilerplate contracts, the Medicaid and CHIP revised final rule for Medicaid managed care, and the additional documentation that outlines DHCS' proposed approach to implementing CMS' final rule (DHCS Medicaid Managed Care Final Rule: Network Adequacy Standards revised March 26, 2018). HSAG identified differences across these source documents and summarized any gaps. This qualitative approach identified differences between the State's current network monitoring program and the requirements outlined in the Medicaid and CHIP managed care final rule (42 CFR §438).

### Methodology for Gap Identification

HSAG used the 2016 Medicaid and CHIP revised final rule for Medicaid managed care as the basis for conducting the desk review. The rule's most recent revisions were finalized in 2016; therefore, this version of the rule was the most current final rule available at the time of the desk review. To assess the extent to which DHCS' proposed approach to implementing the final rule supports network adequacy and timely access, HSAG compared 42 CFR §438.68 Network adequacy standards, 42 CFR §438.206 Availability of services, and 42 CFR §438.207 Assurances of adequate capacity and services to the DHCS Medicaid Managed Care Final Rule: Network Adequacy Standards, KKA, and the MCMC boilerplate contracts (i.e., source documents).

When evaluating these source documents, HSAG used the following scale:

- Exact Match: Language was identified that exactly matched the Medicaid managed care final rule with no opportunities to enhance or improve the language.
- Partial Match: Language was identified that partially matched or showed intent to align with the Medicaid managed care final rule, which DHCS may consider revising to strengthen alignment with the rule.
- **No Match:** No language was identified as related to the Medicaid managed care final rule, and DHCS should consider adding language to align with the rule.

HSAG identified DHCS rule implementation gaps only for those areas of the CFR that did not have an "Exact Match" identified within at least one of the source documents. If an "Exact Match" was identified within only one source document, HSAG considered the State's current network monitoring program to sufficiently address the requirements outlined in the CHIP and Medicaid managed care final rule. The State may still elect to update language in the source documents listed as a "Partial Match" or "No Match" to further increase contractor accountability for compliance with the applicable CFR.

## **Findings**

Table 5.20 displays an overview of each CFR area and the general findings based on the source document review. While each associated part and subpart of all applicable rules was reviewed in full, the CFR areas displayed in Table 5.20 are summarized to provide a concise display of the findings.

**Table 5.20—Comparison of CFR to Source Documents** 

\*Indicates CFR areas with no "Exact Match" findings for any of the assessed standards.

CFR Area	DHCS Medicaid Managed Care Final Rule: Network Adequacy Standards	KKA	MCMC Boilerplate Contracts		
42 CFR §438.68 Network adeq	uacy standards				
Provider type-specific network adequacy time and distance standards	Exact Match	Partial Match	Partial Match		
Scope of network adequacy standards	Exact Match	Partial Match	Partial Match		
Development of network adequacy standards	Exact Match	Partial Match	Partial Match		
Consideration for development of LTSS standards*	Partial Match	No Match	No Match		
Exceptions process*	Partial Match	No Match	No Match		
Publication of network adequacy standards	Exact Match	Partial Match	No Match		
42 CFR §438.206 Availability of	of services				
State plan services are available and accessible to enrollees of MCOs, PIHPs, and PAHPs in a timely manner, and networks meet network adequacy standards*	Partial Match	Partial Match	Partial Match		
Maintains and monitors a network that is sufficient to provide access to all enrollees for all contracted services	Exact Match	Partial Match	Partial Match		

CFR Area	DHCS Medicaid Managed Care Final Rule: Network Adequacy Standards	KKA	MCMC Boilerplate Contracts
Direct access to women's health specialist for female enrollees	No Match	Exact Match	Exact Match
Second opinion at no cost	Partial Match	Exact Match	Partial Match <sup>28</sup>
Access to out-of-network providers in a timely manner when services are not available in network	Exact Match	No Match	Exact Match
Out-of-network providers coordinate with the plan for payment, and cost does not exceed in-network cost	No Match	No Match	Exact Match
Credentialing of in-network providers	Exact Match	Partial Match	Exact Match
Access to family planning providers	No Match	No Match	Exact Match
Network must meet timely access standards and consider urgency	Exact Match	Exact Match	Exact Match
Network hours of operation are no less than those offered to commercial enrollees or are comparable to Medicaid FFS	Partial Match	No Match	Exact Match
Contracted services are available 24 hours/day, 7 days/week when medically necessary*	Partial Match	Partial Match	Partial Match
Mechanisms to ensure network provider compliance	Exact Match	Exact Match	Exact Match

<sup>&</sup>lt;sup>28</sup> The overall intent of the rule appears to have been met; however, this item was identified as a partial match since there was no specification of making arrangements for a member to obtain services out of network.

CFR Area	DHCS Medicaid Managed Care Final Rule: Network Adequacy Standards	KKA	MCMC Boilerplate Contracts
Monitor network providers to determine compliance	Exact Match	Exact Match	Exact Match
Take corrective action if network provider fails to comply	Exact Match	Partial Match	Partial Match
Access and cultural considerations	Exact Match	Partial Match	Exact Match
Accessibility considerations	Exact Match	Partial Match	Exact Match
Applicability date	Exact Match	Partial Match	Not Applicable <sup>29</sup>
42 CFR §438.207 Assurances	of adequate capacity	and services	
Assurances of capacity to serve the expected enrollment according to State standards	Exact Match	No Match	Partial Match
Nature of supporting documentation	Exact Match	Partial Match	Exact Match
Timing of documentation	Exact Match	Partial Match	Partial Match
CMS' right to inspect documentation	Exact Match	No Match	Exact Match
Applicability date	Exact Match	No Match	Not Applicable <sup>29</sup>

While some CFR areas are listed as "No Match" or "Partial Match" for multiple source documents, only four CFR areas had no source documents with an "Exact Match," demonstrating four gaps in DHCS' proposed approach for implementing the Medicaid and CHIP revised final rule for Medicaid managed care, specific to network adequacy and availability of services. These four areas are shaded in light red in the associated cells in Table 5.20 and described in detail in the Conclusions and Considerations section of this report.

\_

<sup>&</sup>lt;sup>29</sup> Applicability date does not pertain to the 2014 boilerplate contracts since the rule applies to the rating period for contracts with MCOs, PIHPs, and PAHPs beginning on or after July 1, 2018. Until that applicability date, states are required to continue to comply with §438.206 contained in 42 CFR parts 430 to 481, edition revised as of October 1, 2015.

# 6. Conclusions and Considerations

While there were a few areas in which individual MCPs did not meet standards, the results of the 2017–18 Access Assessment suggest there are no critical access issues requiring immediate attention. Several themes emerged from the assessment and are described below.

In general, areas with rural urbanicity showed more challenges with access to care. There was significantly greater utilization of telehealth services in rural areas; however, given the relatively small utilization rate for adult telehealth services and the nearly non-existent use of telehealth services for pediatric services, it is unclear whether telehealth services were sufficient to compensate for some of the challenges associated with health care in rural regions of the State.

Results indicated unused provider capacity that can be leveraged both within the pool of providers contracted with MCPs and within the pool of physicians licensed to practice within California, although this may not hold for specific types of specialty providers or all urbanicity regions.

The results of the analyses suggest a number of opportunities and considerations:

- In general, MCPs can increase the number of non-physician medical practitioners and still be well within the physician to non-physician medical practitioner ratio requirements.
- Increases in telehealth services may serve to enhance access for beneficiaries in rural regions, particularly to specialized services, although additional, more focused research may be necessary to fully understand the extent to which this is feasible and effective.
- Approximately 36 percent of physicians licensed to practice in California were not contracted with an MCP, which presents an opportunity to expand or enhance MCP physician networks. However, it should be noted that data available for this analysis were insufficient to determine available capacity in rural regions of the State.
- For non-facility-based providers statewide, between 48 and 62 percent of providers contracted with a given MCP had provided services to an MCP beneficiary for which they were contracted. The active rate for facility-based providers was 20 percent. Greater engagement of contracted providers could expand and/or enhance MCMC beneficiaries' access to services.
- Both DHCS and MCPs should consider partnerships with HRSA or HRSA grantees to implement and ensure compliance with rural health best practices.

While the results of the assessment provide insight into the current state of access to care for MCMC beneficiaries, there are also areas of future research that may provide additional insight and improve access:

 Use of grievance and complaint data provides an avenue to identify unmet needs but relies on beneficiary self-selection, producing results that are likely to be biased. The inclusion of survey data, such as CAHPS, may help to enhance future access assessments or related research.

♦ A follow-up study examining the use of telehealth services in less densely populated regions to determine the extent to which telehealth services are sufficiently allowing beneficiaries in rural and small urbanicity regions to obtain necessary specialist services could provide a quantitative estimate of this relationship.

Using the results of telehealth research, DHCS may want to consider development of specific measures and corresponding standards for the provision of telehealth services in rural and small urbanicity regions of the State that would reasonably be expected to ensure adequate access to Medi-Cal services.

#### Access to Care Monitoring

Based on HSAG's review of the available source documents, DHCS demonstrated an overall well-defined, compliant approach to implementing the final rule in support of network adequacy and timely access standards. DHCS' website included the published network adequacy standards and exceptions as well as the DHCS proposal which explained its approach in an easily understandable manner for public view. While language contained in the published MCMC boilerplate contracts could be updated to show a clearer association with DHCS' approach, DHCS generally had documentation to support CFR alignment when combined with other available source documents. DHCS also showed robust stakeholder engagement in its implementation strategy, which is a commendable step to ensuring network and managed care plan compliance.

HSAG identified four gaps in DHCS' proposed approach for implementing the final rule as related to 42 CFR §438.68 Network adequacy standards and 42 CFR §438.206 Availability of services. These gaps are related to the following topics:

- 1. Development of LTSS standards
- 2. Exceptions process
- 3. State plan services availability and accessibility
- 4. Contracted services availability

Details about each gap are presented below.

#### **Development of LTSS Standards**

While the DHCS Medicaid Managed Care Final Rule: Network Adequacy Standards source document outlined the details of the process by which DHCS developed the LTSS network adequacy standards, no language was identified in any source documents which

—Draft Copy for Review—

<sup>&</sup>lt;sup>30</sup> Assembly Bill (AB) 205 (Chapter 738, Statutes of 2017) codified and amended California's network adequacy standards.

acknowledged that the enrollee's choice of provider was considered in the development of the LTSS standards. Additionally, no source document language outlined LTSS network standards development strategies that would ensure the health and welfare of the enrollee and support community integration of the enrollee. Although DHCS will operationalize these state-specific standards in WIC §14197, DHCS could reduce ambiguity in this area by formally documenting that the enrollee's choice of provider was considered in development of the LTSS network adequacy standards and by documenting which LTSS network adequacy development strategies it used to ensure the health and welfare of the enrollee and support of the enrollee's community integration.

This gap resulted from missing language specific to 42 CFR §438.68(b)(3)(c)(2)(i-iv):

- States developing standards consistent with paragraph (b)(2) of this section (i.e., LTSS standards) must consider the following:
  - All elements in paragraphs (c)(1)(i) through (ix) of this section
  - Elements that would support an enrollee's choice of provider
  - Strategies that would ensure the health and welfare of the enrollee and support community integration of the enrollee
  - Other considerations that are in the best interest of enrollees that need LTSS

#### **Exceptions Process**

While Section 4.10 Alternative Access Standards of the DHCS Medicaid Managed Care Final Rule: Network Adequacy Standards source document contained language to describe the process by which exceptions to the established network adequacy standards would be considered, and the DHCS website included the publication of the network adequacy standard exceptions and annual report to CMS, the boilerplate contract source documents did not contain language that specified the exceptions process as required by the CFR. DHCS could close this gap by ensuring all MCO, PIHP, or PAHP contracts include language that specifies the standard by which any provider-specific network standard exceptions will be evaluated and approved. DHCS has indicated that an updated contract version which addresses this requirement is under review by CMS.

This gap resulted from missing language specific to CFR § 438.68(d)(1)(i):

- To the extent the State permits an exception to any of the provider-specific network standards developed under this section, the standard by which the exception will be evaluated and approved must be:
  - Specified in the MCO, PIHP, or PAHP contract.

#### State Plan Services Availability and Accessibility

Although the source documents all included detailed descriptions of the covered services and network adequacy standards expectations, and the *DHCS Medicaid Managed Care Final Rule:* Network Adequacy Standards source document acknowledged that State plan services should

be available and accessible to MCO, PIHP, and PAHP enrollees, a gap still exists as source documents did not contain an explicit statement indicating that the services available to MCO, PIHP, and PAHP enrollees include all State plan services. DHCS could consider closing this gap by adding a statement to at least one source document to clearly explain that the services covered under the State plan are included in the definition of "covered services" and are made available and accessible to all plan enrollees in compliance with standards developed by the State. This type of definitive statement would provide assurances that DHCS ensures all State plan covered services are available to MCO, PIHP, and PAHP enrollees in a timely manner. DHCS has indicated that an updated contract version which addresses this requirement is under review by CMS.

This gap resulted from missing language specific to 42 CFR §438.206(a):

Basic rule. Each State must ensure that all services covered under the State plan are available and accessible to enrollees of MCOs, PIHPs, and PAHPs in a timely manner. The State must also ensure that MCO, PIHP, and PAHP provider networks for services covered under the contract meet the standards developed by the State in accordance with §438.68.

#### **Contracted Services Availability**

While source documents demonstrated a reference to the availability of emergency services 24 hours a day, seven days a week, these documents did not include language indicating whether emergency services are the only contracted services expected to be made available 24 hours a day, seven days a week. DHCS could add clarity in this area by adding language to specify if there are additional medically necessary services under its contracts which the plans should ensure are available 24 hours a day, seven days a week, or if the list of these services only includes emergency services. DHCS has indicated that this requirement will be addressed in the 2019–20 contract amendment.

This gap resulted from missing language specific to 42 CFR § 438.206(c)(1)(iii):

- Furnishing of services. The State must ensure that each contract with a MCO, PIHP, and PAHP complies with the following requirements.
  - (1) Timely access. Each MCO, PIHP, and PAHP must do the following:
    - (iii) Make services included in the contract available 24 hours a day, seven days a week, when medically necessary.

#### **Assurances of Adequate Capacity and Services**

No gaps were identified related to 42 CFR §438.207 Assurances of adequate capacity and services. A review of all source documents demonstrated that all elements of the applicable CFR were met in this area.

- CBAS—Community Based Adult Services
- COHS—County Organized Health System
- CP—commercial plan
- DHCS—California Department of Health Care Services
- ENT—Ophthalmology, Otolaryngology, Rhinology
- FTE—full-time equivalent
- FQHC—federally qualified health center
- ◆ GMC—Geographic Managed Care
- ICF—intermediate care facility
- KKA—Knox-Keene Health Plan Service Act of 1975
- ♦ MCP—managed care health plan
- NP—nurse practitioner
- ◆ PA—physician assistant
- ♦ PCP—primary care physician
- ◆ RHC—rural health clinic
- SNF—skilled nursing facility

# Appendix A. Medi-Cal Managed Care Health Plan **Reporting Unit and Urbanicity**

#### Table A.1—Medi-Cal Managed Care Health Plan Reporting Unit and Urbanicity

\*Urbanicity is based on the criteria defined by DHCS' final Network Adequacy Policy. The categories of counties are based on population count: Rural—fewer than 50 people per square mile, Small—51-200 people per square mile, Medium—201-600 people per square mile, and Large—more than 600 people per square mile.

\*\*Region 1 includes Butte, Colusa, Glenn, Plumas, Sierra, Sutter, and Tehama counties. Region 2 includes Alpine, Amador, Calaveras, El Dorado, Inyo, Mariposa, Mono, Nevada, Placer, Tuolumne, and Yuba counties. KP North includes Amador, El Dorado, Placer, and Sacramento counties.

# Appendix D. Availability of Services Supplemental Tables

### Access-Related Complaints, Grievances, and Appeals

Note the following regarding Table D.1:

- ♦ Rates were calculated per 1,000 MM. Each rolling "quarter" consists of four reporting quarters (e.g., Q1 2017 = Q2 2016, Q3 2016, Q4 2016, and Q1 2017).
- Kaiser NorCal and Kaiser SoCal rates were combined for the Kaiser rate.
- ♦ To satisfy the HIPAA Privacy Rule's de-identification standard, Gold Coast's rates have been suppressed (indicated by "S") because the numerator for this indicator was less than 11.

Table D.1—12-Month Grievance Rates, by Rolling Quarter

### Table D.23—PPC-Post, by Age

Note that most MCPs are too small to report for children.

- = Indicates the MCP's measure rate exceeded the high performance level.
  - = Indicates the MCP's measure rate was below the minimum performance level.

NA indicates the eligible population of the MCP was too small to report (i.e., the eligible population < 30).

МСР	Adult	Child*	AII
AAH	68.2%	NA	68.3%

#### Table D.24—PPC-Post, by Urbanicity

- = Indicates the MCP's measure rate exceeded the high performance level.
- = Indicates the MCP's measure rate was below the minimum performance level.
- Indicates the MCP did not operate in counties of the indicated urbanicity.
